SmartSlice GRT1 Series Slice I/O Units

OPERATION MANUAL

OMRON

SmartSlice GRT1 Series Slice I/O Units

Operation Manual

Revised October 2007

Notice:

OMRON products are manufactured for use according to proper procedures by a qualified operator and only for the purposes described in this manual.

The following conventions are used to indicate and classify precautions in this manual. Always heed the information provided with them. Failure to heed precautions can result in injury to people or damage to property.

- **DANGER** Indicates an imminently hazardous situation which, if not avoided, will result in death or serious injury. Additionally, there may be severe property damage.
- **WARNING** Indicates a potentially hazardous situation which, if not avoided, could result in death or serious injury. Additionally, there may be severe property damage.
- **Caution** Indicates a potentially hazardous situation which, if not avoided, may result in minor or moderate injury, or property damage.

OMRON Product References

All OMRON products are capitalized in this manual. The word "Unit" is also capitalized when it refers to an OMRON product, regardless of whether or not it appears in the proper name of the product.

The abbreviation "Ch," which appears in some displays and on some OMRON products, often means "word" and is abbreviated "Wd" in documentation in this sense.

The abbreviation "PLC" means Programmable Controller. "PC" is used, however, in some Programming Device displays to mean Programmable Controller.

Visual Aids

The following headings appear in the left column of the manual to help you locate different types of information.

- **Note** Indicates information of particular interest for efficient and convenient operation of the product.
- 1,2,3... 1. Indicates lists of one sort or another, such as procedures, checklists, etc.

About this Manual:

This manual describes the installation and operation of the Slice I/O Units and includes the sections described below. Please read this manual carefully and be sure you understand the information provided before attempting to install or operate Slice I/O Units. **Be sure to read the precautions provided in the following section.**

The following manuals also cover information related to DeviceNet applications in which Slice I/O Terminals are used. Use the *DeviceNet Operation Manual* together with other required manuals.

Manual	Contents	Cat. No.
SmartSlice GRT1 Series Slice I/O Units Operation Manual (this manual)	Describes the models, specifications, functions, operating proce- dures, and applications of GRT1-series Slice I/O Units.	
DeviceNet Communications Unit for Slice I/O Terminals Operation Manual	Describes the specifications, functions, operating procedures, and applications of the DeviceNet Communications Unit, which allows Slice I/O Units to be set, controlled, and monitored through DeviceNet.	W454
DeviceNet Operation Manual	Describes the configuration and construction of a DeviceNet network, including installation procedures and specifications for cables, con- nectors, and other connection devices, as well as information on functions, operating procedures, and applications. Read this manual carefully and be sure you understand the informa-	W267
	tion provided before attempting to use DeviceNet.	
CS/CJ Series DeviceNet Units Operation Manual	Describes the specifications, functions, operating procedures, and applications of CS-series and CJ-series DeviceNet Units. (A CS/CJ- series DeviceNet Unit can operate as both a DeviceNet Master and DeviceNet slave at the same time.)	W380
DeviceNet Configurator Ver. 2. Operation Manual	Describes the operating procedures of the DeviceNet Configurator. The DeviceNet Configurator can be used to configure, set, and main- tain a DeviceNet system through an easy-to-use graphical interface. Refer to this manual when necessary.	W382
SmartSlice PROFIBUS Communications Unit Operation Manual	Describes the specifications, functions, operating procedures, and applications of the GRT1-PRT PROFIBUS Communications Unit, which allows Slice I/O Units to be set, controlled, and monitored through PROFIBUS.	W04E
PROFIBUS Master Units Operation Manual	Describes the specifications, functions, operating procedures, and applications of CS-series and CJ-series PROFIBUS Master Units.	W409
CX-Profibus Ver. 1.0 Operation Manual	Describes the operating procedures of CX-Profibus. The CX-Profibus can be used to configure, set, and maintain a PROFIBUS system through an easy-to-use graphical interface. Refer to this manual when necessary.	W05E

Precautions provides general precautions for planning, installing, and operating the Slice I/O Units and related devices.

Section 1 describes the features of GRT1-series Slice I/O Units and lists the available Units.

Section 2 describes the specifications and functions that are shared by all of the Slice I/O Units.

Section 3 explains how to install and wire the Slice I/O Units.

Section 4 provides the specifications and shows the components, terminal arrangements, wiring diagrams, and dimensions for the Digital Slice I/O Units.

Section 5 provides the information required to operate Analog Input Units and Analog Output Units, including functions, status areas, windows, specifications, wiring, data allocation, and settings.

Section 6 provides the information required to operate the Temperature Input Unit, including functions, status areas, windows, specifications, wiring, data allocation, and settings.

Section 7 provides information required to operate Counter Units and Positioning Units, including functions, status areas, windows, specifications, wiring, I/O data assignments, and settings.

Section 8 provides the basic specifications and shows the components, wiring diagrams, and dimensions for the other Units used in Slice I/O Terminals.

Section 9 describes error processing and troubleshooting procedures needed to keep the Slice I/O Units operating properly.

The *Appendices* provide information on using explicit messages; tables of standard models, power consumptions, current consumptions, and weights; and precautions for using two-wire DC sensors.

WARNING Failure to read and understand the information provided in this manual may result in personal injury or death, damage to the product, or product failure. Please read each section in its entirety and be sure you understand the information provided in the section and related sections before attempting any of the procedures or operations given.

Read and Understand this Manual

Please read and understand this manual before using the product. Please consult your OMRON representative if you have any questions or comments.

Warranty and Limitations of Liability

WARRANTY

OMRON's exclusive warranty is that the products are free from defects in materials and workmanship for a period of one year (or other period if specified) from date of sale by OMRON.

OMRON MAKES NO WARRANTY OR REPRESENTATION, EXPRESS OR IMPLIED, REGARDING NON-INFRINGEMENT, MERCHANTABILITY, OR FITNESS FOR PARTICULAR PURPOSE OF THE PRODUCTS. ANY BUYER OR USER ACKNOWLEDGES THAT THE BUYER OR USER ALONE HAS DETERMINED THAT THE PRODUCTS WILL SUITABLY MEET THE REQUIREMENTS OF THEIR INTENDED USE. OMRON DISCLAIMS ALL OTHER WARRANTIES, EXPRESS OR IMPLIED.

LIMITATIONS OF LIABILITY

OMRON SHALL NOT BE RESPONSIBLE FOR SPECIAL, INDIRECT, OR CONSEQUENTIAL DAMAGES, LOSS OF PROFITS OR COMMERCIAL LOSS IN ANY WAY CONNECTED WITH THE PRODUCTS, WHETHER SUCH CLAIM IS BASED ON CONTRACT, WARRANTY, NEGLIGENCE, OR STRICT LIABILITY.

In no event shall the responsibility of OMRON for any act exceed the individual price of the product on which liability is asserted.

IN NO EVENT SHALL OMRON BE RESPONSIBLE FOR WARRANTY, REPAIR, OR OTHER CLAIMS REGARDING THE PRODUCTS UNLESS OMRON'S ANALYSIS CONFIRMS THAT THE PRODUCTS WERE PROPERLY HANDLED, STORED, INSTALLED, AND MAINTAINED AND NOT SUBJECT TO CONTAMINATION, ABUSE, MISUSE, OR INAPPROPRIATE MODIFICATION OR REPAIR.

Application Considerations

SUITABILITY FOR USE

OMRON shall not be responsible for conformity with any standards, codes, or regulations that apply to the combination of products in the customer's application or use of the products.

At the customer's request, OMRON will provide applicable third party certification documents identifying ratings and limitations of use that apply to the products. This information by itself is not sufficient for a complete determination of the suitability of the products in combination with the end product, machine, system, or other application or use.

The following are some examples of applications for which particular attention must be given. This is not intended to be an exhaustive list of all possible uses of the products, nor is it intended to imply that the uses listed may be suitable for the products:

- Outdoor use, uses involving potential chemical contamination or electrical interference, or conditions or uses not described in this manual.
- Nuclear energy control systems, combustion systems, railroad systems, aviation systems, medical equipment, amusement machines, vehicles, safety equipment, and installations subject to separate industry or government regulations.
- Systems, machines, and equipment that could present a risk to life or property.

Please know and observe all prohibitions of use applicable to the products.

NEVER USE THE PRODUCTS FOR AN APPLICATION INVOLVING SERIOUS RISK TO LIFE OR PROPERTY WITHOUT ENSURING THAT THE SYSTEM AS A WHOLE HAS BEEN DESIGNED TO ADDRESS THE RISKS, AND THAT THE OMRON PRODUCTS ARE PROPERLY RATED AND INSTALLED FOR THE INTENDED USE WITHIN THE OVERALL EQUIPMENT OR SYSTEM.

PROGRAMMABLE PRODUCTS

OMRON shall not be responsible for the user's programming of a programmable product, or any consequence thereof.

Disclaimers

CHANGE IN SPECIFICATIONS

Product specifications and accessories may be changed at any time based on improvements and other reasons.

It is our practice to change model numbers when published ratings or features are changed, or when significant construction changes are made. However, some specifications of the products may be changed without any notice. When in doubt, special model numbers may be assigned to fix or establish key specifications for your application on your request. Please consult with your OMRON representative at any time to confirm actual specifications of purchased products.

DIMENSIONS AND WEIGHTS

Dimensions and weights are nominal and are not to be used for manufacturing purposes, even when tolerances are shown.

PERFORMANCE DATA

Performance data given in this manual is provided as a guide for the user in determining suitability and does not constitute a warranty. It may represent the result of OMRON's test conditions, and the users must correlate it to actual application requirements. Actual performance is subject to the OMRON Warranty and Limitations of Liability.

ERRORS AND OMISSIONS

The information in this manual has been carefully checked and is believed to be accurate; however, no responsibility is assumed for clerical, typographical, or proofreading errors, or omissions.

PRECAUTIONS

This section provides general precautions for installing and using the GRT1-series Slice I/O Units and related devices.

The information contained in this section is important for the safe and reliable application of the Slice I/O Units. You must read this section and understand the information contained before attempting to set up or operate a Slice I/O Terminal.

1	Intended Audience	xvi
2	General Precautions	xvi
3	Safety Precautions	xvi
4	Operating Environment Precautions	xvii
5	Application Precautions	xviii
6	EC Directives	XX

1 Intended Audience

This manual is intended for the following personnel, who must also have knowledge of electrical systems (an electrical engineer or the equivalent).

- Personnel in charge of purchasing FA systems.
- Personnel in charge of designing FA systems.
- Personnel in charge of installing and connecting FA systems.
- Personnel in charge of managing FA systems and facilities.

2 General Precautions

The user must operate the product according to the specifications described in the operation manuals.

Before using the product under conditions which are not described in the manual or applying the product to nuclear control systems, railroad systems, aviation systems, vehicles, combustion systems, medical equipment, amusement machines, safety equipment, and other systems, machines, and equipment that may have a serious influence on lives and property if used improperly, consult your OMRON representative.

Make sure that the ratings and performance characteristics of the product are sufficient for the systems, machines, and equipment, and be sure to provide the systems, machines, and equipment with redundant safety mechanisms.

This manual provides information for installing and operating OMRON DeviceNet products. Be sure to read this manual before operation and keep this manual close at hand for reference during operation.

WARNING It is extremely important that a PLC and all PLC Units be used for the specified purpose and under the specified conditions, especially in applications that can directly or indirectly affect human life. You must consult with your OMRON representative before applying a PLC system to the above mentioned applications.

3 Safety Precautions

WARNING Never attempt to disassemble any Units or touch the terminal block while power is being supplied. Doing so may result in serious electrical shock.

- WARNING Provide safety measures in external circuits (i.e., not in the Programmable Controller), including the following items, to ensure safety in the system if an abnormality occurs due to malfunction of the PLC or another external factor affecting the PLC operation. Not doing so may result in serious accidents.
 - Emergency stop circuits, interlock circuits, limit circuits, and similar safety measures must be provided in external control circuits.
 - The PLC will stop operation when its self-diagnosis function detects any error or when a severe failure alarm (FALS) instruction is executed. As a countermeasure for such errors, external safety measures must be provided to ensure safety in the system.

1

- The PLC outputs may remain ON or OFF due to deposits on or burning of the output relays, or destruction of the output transistors. As a countermeasure for such problems, external safety measures must be provided to ensure safety in the system.
- When the 24-V DC output (service power supply to the PLC) is overloaded or short-circuited, the voltage may drop and result in the outputs being turned OFF. As a countermeasure for such problems, external safety measures must be provided to ensure safety in the system.
- Slice I/O Terminals will continue operating even if one or more I/O Units is removed from or falls out of the Slice I/O Terminal, i.e., the other I/O Units will continue control operations, including outputs. As a countermeasure for such a possibility, external safety measures must be provided to ensure safety in the system.
- **WARNING** The CPU Unit refreshes I/O even when the program is stopped (i.e., even in PROGRAM mode). Confirm safety thoroughly in advance before changing the status of any part of memory allocated to Output Units, Special I/O Units, or CPU Bus Units. Any changes to the data allocated to any Unit may result in unexpected operation of the loads connected to the Unit. Any of the following operations may result in changes to memory status.
 - Transferring I/O memory data to the CPU Unit from a Programming Device
 - Changing present values in memory from a Programming Device
 - Force-setting/-resetting bits from a Programming Device
 - Transferring I/O memory files from a Memory Card or EM file memory to the CPU Unit
 - Transferring I/O memory from a host computer or from another PLC on a network
- WARNING Turn OFF the AC power supply to an AC Input Unit before replacing the AC Input Unit. Not doing so may result in electric shock.
 - Caution Correctly connect the Slice I/O Units to each other. The I/O power supply will become disconnected if the base blocks on the Slice I/O Units are not connected correctly.
 - Caution While outputs are being transmitted from the Master Unit, the output indicators on the Output Unit will be lit, but the outputs will actually be OFF. Refer to 9-4 Other Errors for details.

4 **Operating Environment Precautions**

Install the system properly according to the directions in this manual.

Do not operate the control system in the following places.

- Locations subject to direct sunlight.
- Locations subject to temperatures or humidity outside the range specified in the specifications.
- Locations subject to condensation as the result of severe changes in temperature.
- · Locations subject to corrosive or flammable gases.

- Locations subject to dust (especially iron dust) or salts.
- Locations subject to water, oil, or chemicals (Digital I/O Units)
- Locations subject to acid or chemicals.
- Locations subject to shock or vibration.

Take appropriate and sufficient countermeasures when installing systems in the following locations:

- Locations subject to static electricity or other forms of noise.
- Locations subject to strong electromagnetic fields.
- · Locations subject to possible exposure to radioactivity.
- Locations close to power supplies.
- ▲ Caution The operating environment of the PLC System can have a large effect on the longevity and reliability of the system. Improper operating environments can lead to malfunction, failure, and other unforeseeable problems with the PLC System. Be sure that the operating environment is within the specified conditions at installation and remains within the specified conditions during the life of the system.

5 Application Precautions

Observe the following precautions when using the Slice I/O Units.

- Fail-safe measures must be taken by the customer to ensure safety in the event of incorrect, missing, or abnormal signals caused by broken signal lines, momentary power interruptions, or other causes.
- Provide external interlock circuits, limit circuits, and other safety circuits in addition to any provided within the PLC to ensure safety.
- Use the power supplies specified in the operation manuals.
- If the system is installed at a site with poor power supply conditions, take appropriate measures to ensure that the power supply remains within the rated voltage and frequency specifications.
- Provide circuit breakers and other safety measures to provide protection against shorts in external wiring.
- Always ground the system to 100 Ω or less when installing the system to protect against electrical shock.
- Mount the PLC securely on DIN Track or with screws.
- Always turn OFF the power supply when mounting a Slice I/O Unit.
- Always turn OFF the communications power supply and the power supplies to the PLC and Slaves before attempting any of the following.
 - Mounting or removing a Unit such as an I/O Unit, CPU Unit, Memory Cassette, or Master Unit.
 - Mounting or removing Remote I/O Terminal circuit sections.
 - Assembling any devices or racks.
 - Setting rotary switches.
 - Connecting or wiring cables.
 - · Connecting or disconnecting connectors.
- Do not attempt to disassemble, repair, or modify any Units.
- Be sure that all the terminal screws are tightened to the torque specified in the relevant manuals. Loose screws may cause fire, malfunction, or damage the Unit.

- Be sure that all the mounting screws and cable connector screws are tightened to the torque specified in the relevant manuals.
- Be sure that all the communications connector screws are tightened securely. (The communications connector screw torque is 0.5 to 0.6 N•m.)
- Do not remove the label from a Unit before wiring. Always remove the label after completing wiring, however, to ensure proper heat dispersion.
- Use the correct wiring components when wiring.
- Use crimp terminals for wiring. Do not connect bare stranded wires directly to terminals.
- Double-check all wiring before turning ON the power supply.
- When wiring or performing other tasks, do not allow metal objects such as wire strands to enter the Unit.
- Always follow the electrical specifications for terminal polarity, communications path wiring, power supply wiring, and I/O jumpers. Incorrect wiring can cause failures.
- Always wire the Unit as shown in the manual.
- Be sure to press terminals until they are fully seated.
- Mount Units only after checking terminal blocks completely.
- Be sure that the communications cable connectors and other items with locking devices are properly locked into place.
- Do not drop the Unit or subject the Unit to excessive vibration or shock. Doing so may cause malfunction or damage to the Unit.
- Use the special packing box when transporting the Unit. Ensure that the product is handled carefully so that no excessive vibration or impact is applied to the product during transportation.
- Check the user program for proper execution before actually running it with the system.
- Do not bend or pull the cables excessively.
- When connecting communications cables, always turn OFF the PLC power supply, all Slave power supplies, and all communications power supplies.
- Observe the following precautions when wiring the communications cables.
 - Wire the communications cables separately from the power lines or high-tension lines.
 - Do not bend the communications cables excessively.
 - Do not pull on the communications cables excessively.
 - Do not place objects on top of the communications cables.
 - Route communications cables inside ducts.
- Always enable the scan list before operation.
- Before clearing the scan list of a Unit that has user-allocated remote I/O, always confirm that no errors occur after the I/O Area setting is changed to fixed allocation.
- When adding a new node to the network, check that the new node's baud rate is the same as the baud rate set on the other nodes.
- Do not extend connection distances beyond the ranges given in the specifications.
- Be sure that the Slice I/O Units are lined up correctly when mounting them.

6 EC Directives

DeviceNet products conform to EMS and low-voltage level directives as follows:

EMC Directive

OMRON devices that comply with EC Directives also conform to the related EMC standards, so that they can more easily be built in to other devices or the overall machine. The actual products have been checked for conformity to EMC standards. Whether they conform to the standards in the system used by the customer, however, must be checked by the customer.

EMC-related performance of the OMRON devices that comply with EC Directives will vary depending on the configuration, wiring, and other conditions of the equipment or control panel on which the OMRON devices are installed. The customer must, therefore, perform the final check to confirm that devices and the overall machine conform to EMC standards.

Low Voltage Directive

Devices that operate at voltages from 50 to 1,000 VAC or 75 to 1,500 VDC must satisfy the appropriate safety requirements. The applicable standard is EN 61131-2.

Complying with EC Directives

- **1,2,3...** 1. The Slice I/O Units are designed for installation inside control panels. All Slice I/O Units must be installed within control panels.
 - 2. Use reinforced insulation or double insulation for the DC power supplies used for the communications power supply, internal circuit power supply, and the I/O power supplies. Ensure that stable outputs can be provided even if a 10-ms interruption occurs at the input.
 - 3. The Slice I/O Units conform to the EN 61131-2 (Immunity Zone A), EN 61000-6-2, and EN 61000-6-4 standards. AC power connections to Slice I/O Units must use a protection network if the severity levels for Zone A are exceeded. The radiated emission characteristics (10-m regulations) may vary depending on the configuration of the control panel used, other devices connected to the control panel, wiring, and other conditions. You must therefore confirm that the overall machine or equipment complies with EC Directives.

The following examples shows how to reduce noise.

1,2,3...1. Noise from the communications cable can be reduced by installing ferrite cores on the communications cable within 10 cm of the DeviceNet Unit and DeviceNet Communications Unit.

Ferrite Core (Data Line Filter): 0443-164151 (manufactured by Nisshin Electric)

- 2. Wire the control panel with as thick and short cables as possible and ground to 100 Ω min.
- 3. Keep DeviceNet communications cables as short as possible and ground to 100 Ω min.

SECTION 1 Available Units and Features

This section describes the features of GRT1-series Slice I/O Units and lists the available Units.

1-1	Slice I/	O Terminal Introduction	2
	1-1-1	Features of the GRT1-series Slice I/O Units	2
1-2	Availab	le Units	7
	1-2-1	Communications Units	7
	1-2-2	Digital I/O Units	7
	1-2-3	Analog I/O Units.	7
	1-2-4	Counter Units and Positioning Unit	8
	1-2-5	System Units	8
	1-2-6	Connecting Cable	9
	1-2-7	Functions Supported by Slice I/O Units	9
	1-2-8	Slice I/O Unit Installation and Power Supply Methods	10

1-1 Slice I/O Terminal Introduction

A Slice I/O Terminal is a building-block style remote I/O terminal made up of a Communications Unit and a number of Slice I/O Units, which each provide a small number of I/O points. The Slice I/O Units communicate with the host by remote I/O communications (cyclic communications) through the Communications Unit. Remote I/O communications (cyclic communications) can be started just by setting the Communications Unit's node address and turning ON the power supply.

Since the Slice I/O Units expand the system in small I/O increments, a flexible system can be assembled to exactly match various customer applications, with less labor and space.

Up to 64 Slice I/O Units can be connected to one DeviceNet Communications Unit. (Up to 1,024 inputs and outputs can be connected.)

1-1-1 Features of the GRT1-series Slice I/O Units

The GRT1-series Slice I/O Units have the following features.

Features Shared by all Units

Small I/O Increments	The GRT1-series Slice I/O Units have just a few I/O points (2 to 4 points) per Unit, so the application can be flexibly constructed to match the space and capacity requirements.
Building-block Style Terminals	Slice I/O Terminals are building-block style Units that can be expanded by attaching additional Slice I/O Units to the side of the Terminal. Up to 64 Slice I/O Units can be connected to one Communications Unit.
Time-saving Screwless Terminal Blocks	Slice I/O Units are equipped with screwless clamp terminal blocks, which can be wired just by inserting the wire into the terminals. Wires can be removed just by pressing the release button and pulling out the wire.

Slice I/O Terminal Introduction

Section 1-1

Parameter Backup and Restore	Before replacing a Slice I/O Unit for maintenance, the parameter data set in the I/O Unit can be backed up in the connected Communications Unit. The backed up parameter data is compared with the replacement I/O Unit's data and the backed up data is restored to the replacement I/O Unit.
Online Replacement of I/O Units	The Slice I/O Units are made up of 3 blocks (the base block, main block, and terminal block), so the base block can be left connected while replacing the main block and I/O communications can continue with the other I/O Units.
Automatic Baud Rate Recognition	It isn't necessary to set the baud rate on the GRT1-series Slice I/O Units.
Automatic Allocation of Unit Numbers	Unit numbers are allocated automatically to the connected Slice I/O Units from left to right and stored within the Communications Unit. It is not necessary for the user to set these numbers.
Remote I/O Communications	GRT1-series Slice I/O Units communicate with the host Master by remote I/O communications through the Communications Unit. The Slice I/O Units' data is collected in the Communications Unit and exchanged with the Master in a batch.
Unit Conduction Time (Power ON Time) Monitor	This function records the total time that the Slice I/O Unit's internal circuit power has been ON. A warning level can be set in the Unit and a warning flag will be turned ON when the set warning time is exceeded. The Power ON Time can be read with an explicit message command or from the Configurator.
Unit Comments	A user-set name can be assigned to each Unit and recorded in the Unit.
Connected Device Comments	User-set names can be assigned to each I/O device (sensor, valve, etc.) connected to a Unit and recorded in the Unit.
Communications Error History Monitor	The communications error log within the Unit can collect the four most recent communications errors (communications error cause code and communica- tions power supply voltage when error occurred). The information can be read with an explicit message command or from the Configurator.
Last Maintenance Date	The date on which maintenance was performed can be written in the Unit. The date can be written from the Configurator.
Digital I/O Unit Features	
I/O Power Supply Monitor	This function detects whether the I/O power is being supplied and turns ON a warning flag in the Unit if the I/O power supply is OFF. The flags can be read with an explicit message command or from the Configurator.
Input Filter	The input filter function reads the input value several times during the set interval and removes irregular data caused by noise and switch chattering.
	This function can also be used to create ON/OFF delays.
Sensor Power ON Delay	When the I/O power has gone OFF, the sensor power ON delay function blocks inputs for the first 100 ms after the I/O power is turned back ON. This function prevents incorrect inputs caused by inrush current at startup after the

I/O power is turned ON.

Contact Operation Counter	This function can count the number of times each input or output contact changes from OFF to ON (maximum resolution: 50 Hz). A warning set value can be set in the Unit to monitor the number of contact operations, and turn ON a warning flag in the Status Area when the set value is reached. The Configurator or explicit messages can be used to read the information.
Note	The Contact Operation Counter and Total ON Time Monitor cannot be used at the same time for a single contact.
Total ON Time Monitor	This function can record the total ON time of devices connected to the Unit, such as sensors and relays. The total time is stored in the Unit and can be read by the Configurator or explicit messages. A warning set value can be set in the Unit to monitor the total ON time, and turn ON a warning flag in the Status Area when the set value is reached.
Note	The Total ON Time Monitor and Contact Operation Counter cannot be used at the same time for a single contact.
Operation Time Monitor	This function can measure and monitor an Input Unit's operating time. The time required for a bit to go ON or OFF can be measured at high speed within the Unit, so that ladder programming is not required to measure the operating time. The trigger edge (ON \rightarrow OFF or OFF \rightarrow ON), input number, and output number can be selected freely, providing flexibility when testing. A warning set value can be set in the Unit to monitor the operating time, and turn ON a warning flag in the Status Area when the set value is reached.
Analog I/O Unit Features	
Setting the Number of AD Conversion Points	The conversion cycle when both analog input points are used is 2.42 ms max. The AD conversion cycle can be shortened by reducing the number of points used (i.e., the number of AD conversion points).

Moving Average Analog Input Terminals can calculate the average of the past eight analog input values to produce a stable input value even when the input value is unsteady.

ScalingScaling allows values to be converted according to the industry unit required
by the user. It reduces the number of operations requiring ladder program-
ming in the Master CPU Unit. Scaling also supports an offset function for com-
pensating for errors in scaled values.

Peak/Bottom Hold The maximum (peak) and minimum (bottom) values input to Analog Input Terminals can be held. These values can then be compared with alarm set values, and flags turned ON accordingly to indicate the status (comparator function).

Top/Valley Hold (Input
Units Only)The top and valley values for values input to Analog Input Terminals can be
held. The timing of tops and valleys can be monitored with the Top/Valley
Detection Timing Flags. The top and valley values can be compared with
alarm set values, and flags turned ON accordingly to indicate the status (com-
parator function).

Rate of ChangeThe rate of change for values input to Analog Input Terminals can be obtained
for each sampling cycle.

Comparator Values input to Analog Input Terminals or values after math processing can be compared to the alarm set values (HH, H, L, and LL), and the result indicated with the Analog Status Flags. If the result is outside the set range, the Normal Flag (pass signal) is turned ON.

Off-wire Detection With Analog Input Terminals, disconnections can be detected in wiring for analog (voltage or current) inputs that are enabled as AD conversion points.

	The status can be checked at the Master using the Off-wire Detection Flag. This function is valid only for the input ranges 4 to 20 mA and 1 to 5 V.
User Adjustment	Input or output values can be adjusted to compensate for errors in the input or output voltage or current resulting from the characteristics or connection methods of the I/O device. Compensation is performed by applying linear conversion based on the points corresponding to 0% and 100%.
Cumulative Counter	A cumulated value that approximates the integral of analog input or output values over time can be calculated and read.
Communications Error Output (Output Units Only)	The values output by Output Units when errors occur can be set for each output.
Temperature Input Unit F	Features
Moving Average	Temperature Input Units can calculate the average of the past eight input values to produce a stable input value even when the input value is unsteady.
Scaling	Scaling allows values to be converted according to the industry unit required by the user. It reduces the number of operations requiring ladder program- ming in the Master CPU Unit. Scaling also supports an offset function for com- pensating for errors in scaled values.
Peak/Bottom Hold	The maximum (peak) and minimum (bottom) values input to Temperature Input Units can be held. These values can then be compared with alarm set values, and flags turned ON accordingly to indicate the status (comparator function).
Top/Valley Hold	The top and valley values for values input to Temperature Input Units can be held. The timing of tops and valleys can be monitored with the Top/Valley Detection Timing Flags. The top and valley values can be compared with alarm set values, and flags turned ON accordingly to indicate the status (comparator function).
Rate of Change	The rate of change for values input to Temperature Input Units can be obtained for each sampling cycle.
Comparator	Values input to Temperature Input Units or values after math processing can be compared to the alarm set values (HH, H, L, and LL), and the result indicated with the Temperature Status Flags. If the result is outside the set range, the Normal Flag (pass signal) is turned ON.
Off-wire Detection	With Temperature Input Units, disconnections can be detected individually for each sensor input. The status can be checked at the Master using the Offwire Detection Flags.
Input Error Detection Disable	Detection of input errors, including off-wire detection, can be disabled for channels that are not used.
User Adjustment	Input or output values can be adjusted to compensate for errors in the input or output voltage or current resulting from the characteristics or connection methods of the I/O device. Compensation is performed by applying linear conversion based on the points corresponding to 0% and 100%.
Cumulative Counter	A cumulated value that gives the integral of analog input values over time can be calculated and read.
Top or Valley Count	The numbers of times that the top or valley value is reached can be counted, e.g., in an application in which the temperature input value varies in a fixed cycle of temperature change. The host will be notified with a flag when the number of cycles exceeds the set value.

Temperature Zone Counter	The temperature zone counter can be used to measure how long the temper- ature input value is within a user-set temperature range in 1-second incre- ments. The host will be notified with a flag when the measured value exceeds the set value.
Data Comparison between Channels	The temperature differences between input channels 0 and 1 can be calcu- lated and compared to a set value. The host will be notified with a flag when the temperature difference exceeds a set value.
Counter Unit and Position	oning Unit Features
Counter	Each Unit provides one high-speed counter with a 32-bit resolution. Counting is performed in linear fashion, and encoder signals up to 60 kHz can be input with Counter Units and up to 100 kHz can be input with Positioning Units. The Counter Units support 24-V inputs and the Positioning Unit supports either 24-V or line-driver inputs (settable).
Counter Input Modes	The counter can be set to any of the following input modes: • Phase differential ×1 • Phase differential ×2 • Phase differential ×4 • Pulse/direction • Up/down
Speed Measurement	The output pulse frequency is measured and can be read from the I/O area at any time.
Digital Inputs	The Counter Unit supports an input that can be set to operate either as a digi- tal input or an encoder Z-signal input. The Positioning Unit provides both a digital input and an encoder Z-signal input.
	The digital input can be set to reset the counter, preset the counter, or capture the present counter value. Any of these actions can be set to be performed on the rising or falling edge of the digital signal.
	The Z-signal input of the Positioning Unit can be set to reset the counter in various ways.
Digital Outputs	Each Counter Unit provides one digital output and the Positioning Unit pro- vides two digital outputs. A digital output can be used as a general-purpose output, or it can be controlled using a settable counter value comparison range.
Comparison Range	A comparison range can be enabled for the counter value to control a digital output. The output will be turned ON or OFF depending on the relationship between the counter value and the range that is set. Each Counter Unit provides one comparison range.

1-2 Available Units

The following tables list the available GRT1-series Units, categorized by type.

1-2-1 Communications Units

Туре	I/O points	Model number	Description
DeviceNet Communications Unit		GRT1-DRT	Interface Unit that con- nects the DeviceNet Unit with the Slice I/O Units
PROFIBUS Communica- tions Unit		GRT1-PRT	Interface Unit that con- nects the PROFIBUS Unit with the Slice I/O Units.

1-2-2 Digital I/O Units

Туре	I/O points	Model number	Description
DC Input/Transistor	4 inputs (NPN)	GRT1-ID4	4 DC inputs
Output Units	4 inputs (PNP)	GRT1-ID4-1	
	4 outputs (NPN)	GRT1-OD4	4 transistor outputs
	4 outputs (PNP)	GRT1-OD4-1	
	4 outputs (PNP)	GRT1-OD4G-1	
	4 outputs (PNP)	GRT1-OD4G-3	2-A transistor outputs
	8 inputs (NPN)	GRT1-ID8	8 DC inputs
	8 inputs (PNP)	GRT1-ID8-1	
	8 outputs (NPN)	GRT1-OD8	8 transistor outputs
	8 outputs (PNP)	GRT1-OD8-1	
	8 outputs (PNP)	GRT1-OD8G-1	
AC Input Units	4 inputs	GRT1-IA4-1	100 to 120 VAC
	4 inputs	GRT1-IA4-2	200 to 240 VAC
Relay Output Unit	2 outputs	GRT1-ROS2	Relay outputs

1-2-3 Analog I/O Units

Туре	I/O points	Model number	Description
Analog I/O Units	2 inputs	GRT1-AD2	2 analog inputs
	2 outputs	GRT1-DA2V	2 analog voltage outputs
	2 outputs	GRT1-DA2C	2 analog current outputs

1-2-8 Slice I/O Unit Installation and Power Supply Methods

The following installation and power supply methods apply to all GRT1-series Units.

I/O Unit connection	Unit installation	I/O connection	Unit power supply to base block	I/O power supply
Building-block connections with slide connectors on sides of Units	DIN Track instal- lation	Screwless clamp- ing terminal block	Supplied through the Communications Unit or Left Turnback Unit.	Supplied through the Communications Unit, I/O Power Feed Unit, or Left Turnback Unit.

SECTION 2 Shared Specifications and Functions

This section describes the specifications and functions that are shared by all of the Slice I/O Units.

2-1	Specific	cations Shared by the Units	12
	2-1-1	General Specifications	12
	2-1-2	Slice I/O Unit Specifications	12
	2-1-3	LED Indicators	12
2-2	Unit Nu	mbers and I/O Allocations	13
	2-2-1	Unit Numbers of Slice I/O Units (Automatically Allocated)	13
	2-2-2	I/O Allocations in the Slice I/O Terminal's Master Unit	14
2-3	Functio	ns Shared by all Units	17
	2-3-1	Backup Function	17
	2-3-2	Automatic Restore Function	18
	2-3-3	Online Replacement Function	19
	2-3-4	Unit Conduction Time Monitor	20
	2-3-5	Unit Comments	22
	2-3-6	I/O Comments	23
	2-3-7	Communications Error History Monitor	26
	2-3-8	Last Maintenance Date	28

2-1 Specifications Shared by the Units

2-1-1 General Specifications

Item	Specification
Ambient operating temperature	-10 to 55°C (with no icing or condensation)
Ambient operating humidity	25% to 85%
Ambient storage temperature	-25 to 65°C (with no icing or condensation)
Noise immunity	Conforms to IEC61000-4-4, 2.0 kV
Vibration resistance	10 to 60 Hz: 0.7 mm double amplitude 60 to 150 Hz: 50 m/s ²
Shock resistance	150 m/s ²
Withstand voltage	500 VAC (between isolated circuits)
Enclosure rating	IP20

2-1-2 Slice I/O Unit Specifications

Item		Specification	
Communica	ations protocol	Slice bus	
Communica	ations distance	Slice I/O Units: 64 Units coupled (about 2 m max.)	
		Turnback Cable: 2 m max. (2 cables, 1 m each)	
Unit power	supply	Voltage: 24 V DC	
Unit conne	ction method	Building-block style configuration with slide connec- tors on sides of Units	
Unit numbe	er	1 to 64 (automatically allocated)	
I/O power s	supply	Voltage: 24 V DC Current: 4 A max.	
Indicators TS (Two-color LED)		Indicates the Unit's operating status	
IO (One-color LED)		Indicates the I/O status	

2-1-3 LED Indicators

The following table shows the meaning of the Unit's TS and I/O indicators, which are common to all of the Slice I/O Units.

The ERR indicators show errors specific to the Unit, such as I/O errors. Any numbers that immediately follow "ERR" indicate the channel number, e.g. ERR0 indicates a Unit that has an error in channel 0.

Name	Color	S	status		Meaning
TS	Green	TS /	Lit	Normal status	Normal Unit status
					Normal network status
			Flashing	Operating	The automatic restore/backup function is operating.
	Red		Lit	Fatal error	Unit hardware error (EEPROM error or WDT error)
			Flashing	Non-fatal error	Communications timeout, incorrect switch setting, etc.
					Cold junction compensator error (GRT1-TS2T only)
		TS	Not lit	No power	 Unit power supply is OFF. Unit is waiting for initialization. Unit is being reset.

The TS indicator shows the status of the Slice I/O Unit itself and the I/O indicators show the status of the connected devices.

Digital I/O Units

The following table shows the meaning of the yellow I/O indicator.

Name	Color	Status	Meaning		
I/O	Yellow	Lit	Normal status	I/O ON	
		Not lit		I/O OFF	

The following table shows the meaning of the red ERR indicator.

Name	Color	Status		Meaning
ERR	Red	Lit	Error	The error depends on the Unit. Refer to specific infor- mation for the relative Unit.
		Not lit	Normal status	No error has occurred.

2-2 Unit Numbers and I/O Allocations

2-2-1 Unit Numbers of Slice I/O Units (Automatically Allocated)

The numbers used to identify the Slice I/O Units in a Slice I/O Terminal are called the Slice I/O Units' unit numbers. These unit numbers are allocated automatically from left to right starting from #1, when the power is turned ON. It is not necessary for the user to set these numbers.

Note The unit numbers allocated automatically to the Slice I/O Units are unrelated to the DeviceNet node address set with the rotary switches.

2-2-2 I/O Allocations in the Slice I/O Terminal's Master Unit

The Slice I/O Terminal's I/O data is allocated in the CPU Unit's I/O memory and transferred through the Communications Unit and the Unit (such as a DeviceNet Unit) connected to the CPU Unit.

The Communications Unit's Programming Device (such as a Configurator) can be used to freely select the kind of data allocated. Refer to the Communications Unit's operation manual for details.

Slice I/O Terminal

I/O Allocation Example

I/O data is allocated to the I/O Units in the order that they are connected to the Communications Unit, regardless of the I/O Units' models. Unless special allocation data settings are selected with the Communications Unit's Programming Device, data is allocated from the first word starting with the Communications Unit's Status Flags and then the leftmost I/O Unit's data.

Data in the Master's Input and Output Areas is allocated to the Slice I/O Units based on their unit numbers.

Some areas may be unused when data is allocated.

Note I/O Units with bit allocations (such as the GRT1-ID4/OD4) are allocated data in 2-bit units. I/O Units with word allocations (such as the GRT1-AD2) are allocated data in 1-word units. The following example shows the allocations to Output Units.

Silce i/O Terminal Configuration										
Communi- cations Unit	#1 OD4	#2 OD4	#3 OD4		#4 ROS2		‡5 D4	#6 DA2	#7 OD4	#8 OD8
		Data is allocated in 2-bit units to I/O Units that require 4 bits, so there may be unused areas as shown in the following table.								
		Word	d 1:	5	8		0			
			+0 [#] ₅ +1		# #3	#2	#1			
					/ Unused		# 5			
			+2	/	#6					
			+3		/ #0					
			+4		, Unused		#7			
			+5	//u	Unused		3			
				/						

Slice I/O Terminal Configuration

Data in these areas will not be output.
Note As shown in example 1, 0 is entered into any unused area that creates a gap in another area. Such an area cannot be used for any other purpose. If there is more than 1 byte that do not create a gap in any other area, such as in word 4 in example 2, then they can be used for other purposes.

Example Input Area 1 (Total of 10 Bytes)

A 0 will be entered into the unused areas. These areas cannot be used for any other purposes.

If there is more then one unused byte that does not create gaps in any area, then it can be used for another purpose.

Allocated Data Patterns

The following kinds of data can be allocated for the Master. The Programming Device can be used to freely select the kinds/combination of data allocated. If the Programming Device isn't used to select the data pattern, the default setting is used, which is I/O data + Communications Unit Status Flags (pattern number 1 in the following table).

Input Data Patterns and Sizes

Allocated data pattern	Description		
	Description		
1. Input data + Communications	Used input data size + 1 word		
Unit Status Flags	Maximum Input Area: 65 words (with GRT1-DRT)		
2. Input data only	The total of the bit, word, and used areas. Calculate following the previous example.		
	Maximum Input Area: 64 words (with GRT1-DRT)		
3. Communications Unit Status Flags only	1 word (with GRT1-DRT)		
4. Slice I/O Unit Communications	Participating Flags: 4 words		
Participating/Withdrawn Flags	Withdrawn Flags: 4 words		
only	Total: 8 words		

Output Data Patterns and Sizes

Allocated data pattern	Description
Output data only	The total of the bit, word, and used areas. Calculate following the previous example.
	Maximum Input Area: 64 words (with Communica- tions Unit)

- (1) Only one pattern of output data can be allocated.
- (2) When allocating data, be sure that it does not exceed the maximum that can be allocated (64 words).

2-3 **Functions Shared by all Units**

Backup Function 2-3-1

Function Overview

The backup function records the parameter data of all Slice I/O Units connected to the Communications Unit. The parameter data recorded in the Communications Unit can be restored to the Slice I/O Units later with the automatic restore function when a Slice I/O Unit has been replaced.

Backup Procedure when using a DeviceNet **Communications Unit**

- 1,2,3...
 - 1. Verify that the power is ON, DIP switch pin 1 (REGS) is ON, and all of the Slice I/O Units are participating in I/O communications.
 - 2. Turn DIP switch pin 4 (BACK) ON, then OFF, and then ON again within 3 s to start the back up.

3. While the data is being backed up, the DeviceNet Communications Unit's TS indicator will flash green every 0.5 s. The TS indicator will stop flashing (not lit) when the backup is completed.

If the restore operation fails, the TS indicator will be lit red for 2 s.

- Note (1) Do not turn OFF the power supply or reset the Configurator while data is being backed up. The data will not be backed up properly if the power is turned OFF.
 - (2) The backup data will be erased along with the registered I/O configuration table if the power is turned OFF and back ON or if the Unit is restarted while DIP switch pin 1 (REGS) is turned OFF.
 - (3) We recommend backing up the parameter data in case a Unit fails in the future.

2-3-2 Automatic Restore Function

Function Overview

When a Slice I/O Unit has been replaced, this function will automatically download (restore) Slice I/O Unit parameter data that was previously backed up in the Communications Unit. The following conditions are required to execute the automatic restore function:

- DIP switch pin 1 (REGS) was ON when the power was turned ON, so the registered table is enabled.
- DIP switch pin 3 (ADR) was ON when the power was turned ON, so the automatic restore function is enabled.

• Parameter data has been backed up.

Restoration Procedure when using a DeviceNet Communications Unit

- *1,2,3...* 1. Create backup data in the Communications Unit with the backup function.
 - 2. Turn ON DIP switch pin 3 (ADR).

Unit Replacement Procedure

- 1,2,3... 1. Turn OFF the Slice I/O Terminal's power supply and the I/O power supply.
 - 2. Release the hook on the front of the I/O Unit that you want to replace and remove the terminal block. The wiring can remain connected.
 - 3. Remove the main block of the Slice I/O Unit and replace it with a new I/O Unit.
 - 4. Mount the terminal block that was removed in step 2 and latch the hook that was released.

- 5. When the power is turned ON again, the Communications Unit will automatically detect the Unit that was replaced and download the backup data. The I/O Unit's TS indicator will indicate the results of the restore operation.
 - If the download was successful, the Unit will be reset automatically and join I/O communications normally. The I/O Unit's TS indicator will be lit green.
 - If the download failed, the I/O Unit's TS indicator will be flash red.
 - If the connected Unit is the wrong model, the I/O Unit's TS indicator will be lit red.
- Note (1) Do not turn OFF the power or reset the Unit from the Configurator while data is being restored. The data will not be restored properly if the power is turned OFF or the Unit is reset.
 - (2) When an I/O Unit has been replaced with the power ON and the new I/O Unit joins I/O communications, the new Unit will be compared to the previous one and the parameter data restore operation will start automatically. While data is being restored, the DeviceNet Communications Unit's TS indicator will flash green every 0.5 s. The TS indicator will stop flashing (not lit) when the restore operation is completed. If the restore operation fails, the Automatic Restore Monitor Flag (bit 13 of the Communications Unit's TS indicator will be turned ON and the Communications Unit's TS indicator will be lit red for 2 s.

2-3-3 Online Replacement Function

Function Overview

When one of the Slice I/O Units connected to the Communications Unit must be replaced, the Unit can be replaced without turning OFF the Slice Bus Power. Any AC power supplied via the Slice I/O Terminal must always be turned OFF before replacing a Unit.

The Units can be replaced online because the Slice I/O Units are made up of 3 blocks: the base block, main block, and terminal block. When replacing a Slice I/O Unit, leave just the base block connected and replace the main block. I/O communications will continue with the other I/O Units even while the problem Unit is being removed and replaced.

WARNING Turn OFF the AC power supply for any AC Input Unit before replacing the AC Input Unit. Not doing so may result in electric shock.

Replacement Procedure

- 1,2,3... 1. Turn OFF the I/O power supply of the I/O Unit being replaced.
 - 2. Release the hook on the front of the I/O Unit that you want to replace and remove the terminal block. The wiring can remain connected.
 - 3. Remove the main block of the Slice I/O Unit and replace it with a new I/O Unit.
 - 4. Mount the terminal block that was removed in step 2 and latch the hook that was released.
 - 5. Turn ON the I/O power supply.

Note

- (1) When a Unit withdraws from I/O communications during replacement, the corresponding Slice I/O Unit Communications Withdrawn Flag will go ON and the Communications Unit's TS indicator will flash red.
 - (2) Before using the automatic restore function, the preparation for automatic restoration (creating backup data and turning ON DIP switch pin 3) must be completed. See 2-3-2 Automatic Restore Function for details.
 - (3) Always turn OFF the I/O Unit's I/O power supply before replacement in order to prevent false output signals, false input signals, and electrical shocks. In addition, if external power is supplied to the terminal block for a Unit such as a Relay Output Unit, turn OFF that power supply before replacing the Unit.
 - (4) Only replace one I/O Unit at a time.
 - (5) Always replace the I/O Unit with the same model of I/O Unit. If a Unit is replaced with a different model, there may be unexpected outputs and the restore operation may not be completed properly.
 - (6) If the base block is faulty or damaged, turn OFF the power supply and replace the entire Unit. Even in this case, the I/O Unit's parameter data will be restored automatically if the automatic restore function is enabled when the power is turned ON.

2-3-4 Unit Conduction Time Monitor

Function Overview

The total ON time (unit: 0.1 hr) of the Unit's internal circuit power can be calculated and recorded.

A monitor value can be set in the Unit so that the corresponding notification flag in the Status Area will be turned ON when the total time reaches the set monitor value in order to notify the Communications Unit. (Bit 2 of the Communication's Unit's Status Flags will go ON.) The total ON time can be read with a Programming Device.

• Measured time: 0 to 429496729 hours (stored data: 00000000 to FFFFFFF hex)

• Measuring unit: 0.1 hr

Host Master

Note The Unit conduction time monitor (Power ON time monitor) calculates the total time that Network power supply is ON. The total time is not calculated when the power is OFF.

Setting with a Programming Device

This example shows how to use the DeviceNet Configurator (version 2.43 or higher) to set the monitor value for the *Unit Conduction Time*.

- 1,2,3...
 Open the Network Configuration Window and double-click the desired Slice I/O Terminal's icon or right-click the icon and select Parameters -*Edit* to display the Edit Device Parameters Window.
 - 2. Click the **I/O Module** Tab.

- 4. Input the desired monitor value in the Unit Conduction Time Field.
- 5. Click the **Download** Button, and then click the **Reset** Button to reset the Unit.
- 6. Click the **OK** Button.

2-3-5 Unit Comments

Function Overview

The user can assign and record a name or comment for every Unit (up to 32 characters). The network Programming Device can be used to read and write these Unit names (comments).

Setting with a Programming Device

This example shows how to use the DeviceNet Configurator (version 2.43 or higher) to set the Unit Comments.

1,2,3...
 1. Open the Network Configuration Window and double-click the desired Slice I/O Terminal's icon or right-click the icon and select Parameters - *Edit* to display the Edit Device Parameters Window.

2. Click the I/O Module Tab.

- 4. Input the desired name in the *Comment* Field.
- 5. Click the **Download** Button, and then click the **Reset** Button to reset the Unit.
- 6. Click the **OK** Button.

2-3-6 I/O Comments

Function Overview

The user can assign a name for each of the Unit's I/O contacts (up to 32 characters) and record it in the Unit. The connected device can be checked for each I/O contact, allowing faulty devices to be identified during remote maintenance. The network Programming Device can be used to read and write the names (comments) of the connected devices.

Setting with a Programming Device

This example shows how to use the DeviceNet Configurator (version 2.43 or higher) to set the device comments.

- 1. Open the Network Configuration Window and double-click the desired Slice I/O Terminal's icon or right-click the icon and select Parameters *Edit* to display the Edit Device Parameters Window.
 - 2. Select the desired Slice I/O Unit from the list on the I/O Module Tab Page and click the **Edit** Button.
 - 3. Select the IN Tab or OUT Tab. (In this case, the IN Tab has been selected.)

OFF	Delay: 0	•		
Sensor F	Power ON Delay	C Enable		
ło.	1/0 Comment	Detection	Value	
00	Sensor E3X-DA6 OMRON	Time	0

- 5. Click the **General** Tab.
- 6. Click the **Download** Button, and then click the **Reset** Button to reset the Unit.
- 7. Click the **OK** Button.

2-3-7 Communications Error History Monitor

Function Overview

Information on communications error (communications error code, communications power voltage when the error occurred) for the last four communications errors can be recorded in the Unit. The network Programming Device can be used to read that communications error history.

Reading with a Programming Device

This example shows how to use the DeviceNet Configurator (version 2.43 or higher) to check the error information.

1. Open the Network Configuration Window, right-click the desired Slice I/O Terminal's icon, and select **Maintenance Information** from the pop-up menu.

2. Select the desired Slice I/O Unit from the list on the I/O Module Tab Page and click the **View** Button.

2-3-8 Last Maintenance Date

Function Overview	This function can be used to write the date on which maintenance was last
	performed to the Unit. This means that the timing for future maintenance can
	be judged more easily. The date can be written using the network Program-
	ming Device.

Setting with a Programming Device

This example shows how to use the DeviceNet Configurator (version 2.43 or higher) to check the last maintenance date.

- 1. Open the Network Configuration Window and double-click the desired Slice I/O Terminal's icon or right-click the icon and select Parameters *Edit* to display the Edit Device Parameters Window.
 - 2. Select the desired Slice I/O Unit from the list on the I/O Module Tab Page and click the **Edit** Button.
 - 3. Click the **General** Tab and select the desired date from the pull-down menu in the *Last Maintenance Date* Field. (Click the **Today** Button to enter the current date.)

SECTION 3 Installation and Wiring

This section provides information on installing and wiring the Slice I/O Units.

3-1	1 Installation					
	3-1-1	Connecting the Communications Unit and Slice I/O Units	30			
	3-1-2	Connecting Additional Slice I/O Units	31			
	3-1-3	Installation on a DIN Track	32			
3-2 Power		ver Feed Wiring				
	3-2-1	Connecting the Slice I/O Terminal Power Supply	36			
	3-2-2	Wiring Methods	38			
3-3	Connec	cting Turnback Cables	39			
	3-3-1	Connecting Turnback Units	40			

3-1 Installation

The Slice I/O Terminal is installed and set up as a network Slave. The Communications Unit's communications connector connects to the Master Unit through a communications cable.

Up to 64 Slice I/O Units can be connected to one Communications Unit.

Note

- (1) Do not connect or disconnect the Communications Unit's communications cable while the network is operating. Short-circuits or poor contacts in the cable may prevent normal communications.
 - (2) Be sure that the power supplies for the Communications Unit, Slice I/O Units connected to the Communications Unit, and external I/O are wired correctly through the Communications Unit's terminal block.

3-1-1 Connecting the Communications Unit and Slice I/O Units

Connect the first Slice I/O Unit to the Communications Unit by aligning the sides of the Units and sliding in the Slice I/O Unit from the front. Additional Slice I/O Units can be connected consecutively to the first.

In the following example, a Slice I/O Unit is being connected to a DeviceNet Communications Unit.

Note

Do not touch the connector on the Unit's base block.

3-1-2 Connecting Additional Slice I/O Units

Connect additional Slice I/O Units by aligning the sides of the Units and sliding in the next Unit from the front. Up to 64 Slice I/O Units can be connected to one Communications Unit.

Slide the Unit to the DIN Track from the front. Insert the Unit until you hear a click, which indicates that the Unit has locked on the Track. It is not normally necessary to release the DIN Track mounting hook when mounting the Unit.

Connecting Turnback Units

When a Slice I/O Terminal is divided into blocks, connect a GRT1-TBR Right Turnback Unit to the right end of the first block. Connect a GRT1-TBL Left Turnback Unit to the left side of the expansion block and connect additional Slice I/O Units. Use a GCN2-100 Turnback Cable to connect the Turnback Units together.

Note The Turnback Units can be used to divide a Slice I/O Terminal into up to three blocks.

Connecting the End Unit

A GRT1-END End Unit must be connected to the end of the Slice I/O Terminal.

GRT1-END End Unit

Note When connecting Units, always align the guide tracks on the top and bottom of the Units and be sure that they join properly as you slide the Unit toward the DIN Track.

3-1-3 Installation on a DIN Track

DIN Track Installation

PFP-50N (50 cm) or PFP-100N (100 cm) DIN Track Mount the Communications Unit and Slice I/O Units on a DIN Track. Attach the DIN Track with screws in every fourth mounting hole.

Attach the track with screws at a maximum spacing of 105 mm between adjacent screws.

PFP-M End Plate (Two Required)

Slice I/O Terminal Orientation

There is no particular restriction on the Slice I/O Terminal's orientation. The Terminal can be mounted in any of the following 6 directions.

Installing a Unit

Press the Units onto the DIN Track firmly from the front. Press the Unit firmly until it clicks, indicating that the Unit's DIN Track Mounting Hooks have locked onto the DIN Track.

When the Unit is pushed onto the DIN Track, verify that the Mounting Hooks have locked.

- **Note** It is not normally necessary to release the DIN Track mounting hook when mounting the Unit. When the Units are installed on a DIN Track other than the recommended track, the Mounting Hooks may not lock onto the track completely. In that case, release the Mounting Hook locks, mount the Unit on the DIN Track again, and lock the Mounting Hooks.
- **<u>Removing a Unit</u>** Use a standard screwdriver to release the DIN Track Mounting Hooks at the top and bottom of the Unit and pull the Unit straight away from the DIN Track.

Removing an Entire Unit Including the Base Block

- **1,2,3...** 1. Remove the main block of the Unit on the right side of the Slice I/O Unit actually being replaced.
 - 2. Release the Mounting Hook locks of the Unit being replaced. (The hooks attach the Unit to the top and bottom of the DIN Track.)
 - 3. Pull the Unit straight away from the DIN Track.

Removing Just a Unit's Main Block

Press the latches on the top and bottom of the main block and pull the block forward.

Installing the End Plates

Always secure the Slice I/O Terminal on the DIN Track by installing End Plates on both sides of the Terminal. First hook the bottom of the End Plate on the bottom edge of the DIN Track (1), attach the top of the End Plate, and pull the End Plate down onto the top edge of the DIN Track (2).

Tighten the End Plate's securing screw.

3-2 Power Feed Wiring

Both the Slice I/O Terminal power supply and the external I/O power supply are connected with screwless clamp terminals on the Communications Unit.

The following I/O Power Feed Units and I/O Power Connection Units are available. Select the Unit depending on the application. For information on wiring for the GRT1-PD8(-1) and GRT1-PC8(-1), refer to the wiring examples for the GRT1-PD8(-1) and GRT1-PC8(-1) in *SECTION 4 Digital I/O Units*.

Unit	Description
GRT1-PD2 GRT1-PD2G	Used to feed external power to the Units. (The GRT1-PD2G has overcurrent protection.)
GRT1-PD8(-1)	Used to feed external power to the Units and provide more common terminals. Use this Unit if there are not enough common terminals, for example, when using the GRT1-ID8(-1) or GRT1-OD8(-1).
GRT1-PC8(-1)	Used to provide more common terminals. Use this Unit if more common terminals are required, for example, when using the GRT1-ID8(-1) or GRT1-OD8(-1). This Unit cannot be used to feed external power.

3-2-1 Connecting the Slice I/O Terminal Power Supply

The Communications Unit has two sets of power supply terminals for the following two systems.

Power supply terminals	Description
Unit power supply terminals	These terminals supply power to the Communications Unit's internal circuits as well as the connected Slice I/O Units' internal circuits (supplied through the Slice bus).
I/O power supply ter- minals	These terminals supply power to the external I/O that is con- nected to the Terminal's Slice I/O Units.

Evaluating the Power Supply Requirements

Unit Power Supply The maximum power consumption for a Slice I/O Terminal is 80 W per block. 1,2,3... 1. Calculate the power consumption of all of the Slice I/O Units connected to the Communications Unit. 2. If the power consumption exceeds 80 W, mount a Right Turnback Unit (GRT1-TBR) on the Slice I/O Unit at the point where the power consumption is less than 80 W. 3. Connect the 24 VDC Unit power supply to the Left Turnback Unit (GRT1-TBL). Power Consumption of Slice I/O Units For details on the power consumption of the various Slice I/O Units, refer to Appendix C Power Consumption and Weight Tables. Note When dividing the power supply, always wire (supply) the power from the same power supply. (Refer to the following wiring example.) The maximum I/O current consumption is 4 A. I/O Power Supply 1,2,3... Calculate the total current consumption used by all external I/O of the con-1. nected Slice I/O Units (including other Units such as Turnback Units, but excluding the GRT1-OD4G-3, which has a separate I/O power supply connection). 2. If the current consumption exceeds 4 A or you want to provide separate systems for inputs and outputs, divide the Slice I/O Units at the desired point with a GRT1-PD2, GRT1-PD2G, GRT1-PD8 or GRT1-PD8-1 I/O Power Feed Unit, and provide a separate external I/O power supply. 3. It is also possible to provide a separate external I/O power supply at a Left Turnback Unit (GRT1-TBL). I/O Current Consumption of Slice I/O Units For details on the I/O current consumption of the various Slice I/O Units, refer to Appendix D I/O Current Consumption Table. Note (1) Always use isolated power supplies for the power supplies. (2) Power is not supplied through the GCN2-100 Turnback Cable. (Refer to the following wiring example.)

Power Feed Wiring

Section 3-2

Wiring Example

3-2-2 Wiring Methods

Supplying Power to Connect the power supply wires (24 VDC) to the Communications Unit's the Units screwless clamping power supply terminals. If pin terminals are used on the wire ends, the pin terminals can just be inserted to wire the power. Holes for wires (nin terminals) Release button Press the release button with a screwdriver and pull out the wire (pin terminal). These terminals supply power to both the Communications Unit's internal 24 VD circuits and the connected Slice I/O Units' internal circuits. Note The GRT1-TBL Left Turnback Unit has the same screwless clamping power supply terminals. Those terminals are wired in the same way as the Communications Unit's terminals, just by inserting the power supply wires. Supplying Power to The power supply for external I/O devices is supplied through the Communi-External I/O cations Unit's screwless clamping power supply terminals. If pin terminals are used on the wire ends, the pin terminals can just be inserted to wire the power. Release button

Note The GRT1-TBL Left Turnback Unit and GRT1-PD2 I/O Power Feed Unit have the same screwless clamping power supply terminals. Those terminals are wired in the same way as the Communications Unit's terminals, just by inserting the power supply wires.

Press the release button above the terminal hole with a slotted precision screwdriver and pull out the wire.

Use the following screwdriver or an equivalent to remove the wires.

3-3 Connecting Turnback Cables

When a Slice I/O Terminal is divided into blocks to expand the system, connect a GRT1-TBR Right Turnback Unit to the GRT1-TBL Left Turnback Unit with a GCN2-100 Turnback Cable.

Note Power is not supplied through the GCN2-100 Turnback Cable. Always wire (supply) the power to the GRT1-TBL Left Turnback Unit from the same power supply that supplies the Communications Unit.

3-3-1 Connecting Turnback Units

Connect Turnback Units with Turnback Cable, as shown in the following diagram. A single Communications Unit can be expanded with up to two sets of Right/Left Turnback Units.

SECTION 4 Digital I/O Units

This section provides the specifications and shows the components, terminal arrangements, wiring diagrams, and dimensions for the Digital I/O Units.

	4-6-5	Two-point Relay Output Unit: GRT1-ROS2	79
	4-6-6	Four-point AC Input Units: GRT1-IA4-1 and GRT1-IA4-2	81

4-1-1 Specifications Shared by the Units

The following tables show the specifications common to all of the Digital I/O Units. For details on other specifications, refer to the pages describing the individual Slice I/O Unit.

Specifications

Item	Specification
Unit power supply voltage	24 V DC (20.4 to 26.4 V DC)
I/O power supply voltage	24 V DC (20.4 to 26.4 V DC)
Noise immunity	Conforms to IEC61000-4-4, 2.0 kV (power supply line)
Vibration resistance	10 to 60 Hz: 0.7 mm double amplitude
	60 to 150 Hz: 50 m/s ²
Shock resistance	150 m/s ²
Withstand voltage	500 V AC (between isolated circuits)
Insulation resistance	20 M Ω min. (between isolated circuits)
Ambient operating temperature	-10 to 55°C (with no icing or condensation)
Ambient operating humidity	25% to 85%
Operating environment	No corrosive gases
Ambient storage temperature	-25 to 65° C (with no icing or condensation)
Mounting	35-mm DIN Track mounting

Note

Some specifications are different for the GRT1-ROS2 Relay Output Unit. For details, refer to 4-6-5 Two-point Relay Output Unit: GRT1-ROS2.

4-1-2 I/O Data

The following table lists the I/O data allocated to each Digital I/O Unit. Refer also to 2-2-2 I/O Allocations in the Slice I/O Terminal's Master Unit.

Unit name	I/O allocation	Size	Remarks
GRT1-ID4	Bits	4 input bits	
GRT1-ID4-1	Bits	4 input bits	
GRT1-IA4-1	Bits	4 input bits	
GRT1-IA4-2	Bits	4 input bits	
GRT1-OD4	Bits	4 output bits	
GRT1-OD4-1	Bits	4 output bits	
GRT1-OD4G-1	Bits	4 output bits	
GRT1-OD4G-3	Bits	4 output bits	
GRT1-ROS2	Bits	2 output bits	
GRT1-ID8	Word	1 input word	Bits 8 to 15 are not used.
GRT1-ID8-1	Word	1 input word	Bits 8 to 15 are not used.
GRT1-OD8	Word	1 output word	Bits 8 to 15 are not used.
GRT1-OD8-1	Word	1 output word	Bits 8 to 15 are not used.
GRT1-OD8G-1	Word	1 output word	Bits 8 to 15 are not used.

4-2 Status Area

4-2-1 Status Areas of Digital I/O Units

The Digital I/O Units have two status areas. Each Unit's Status Flags are turned ON and OFF based on the threshold/monitor values set for the function in that Unit. A flag in the Communications Unit will be turned ON only when the corresponding flag has been turned ON in one of those status areas.

The Communications Unit's Status Flag information is transmitted to the Master. The I/O Unit's status area information can be read from a Programming Device.

goes ON, the corresponding status flag in the Communications Unit is turned ON

Warning Status Area

The Slice I/O Unit's Warning Status Area contains the following 16 bits. The Warning Status Area provides notification of minor errors detected in the Unit. When any of these flags goes ON, bit 2 of the Communications Unit's Status Flags is turned ON and that information is transmitted to the Master.

Bit	Content	Description
0	Reserved	
1	Reserved	
2	Reserved	
3	Unit Maintenance Flag OFF: Normal ON: Error (Monitor value exceeded.)	Monitors the power ON time warning value set for the Unit Conduction Time Monitor function.
4	Reserved	
5	Reserved	
6	Reserved	
7	Reserved	
8	Operation Time Monitor Flag OFF: Within range (below set value) ON: Out-of-range (exceeded set value)	Monitors whether the operating time for the specified I/O bits is within the warning value set for the Operation Time Monitor function.
9	Connected Device Maintenance Flag OFF: Within range (all points below set value) ON: Out-of-range (one or more points exceeded set value)	Monitors the warning value set for the Contact Operation Counter or Total ON Time Monitor function.
10	Reserved	
11	Reserved	
12	Reserved	
13	Reserved	
14	Reserved	
15	Reserved	

Alarm Status Area

The Slice I/O Unit's alarm status area contains the following 16 bits. The Alarm Status Area provides notification of serious errors detected in the Unit. When any of these flags goes ON, bit 3 of the Communications Unit's Status Flags is turned ON and that information is transmitted to the Master.

Bit	Content	Description	
0	Reserved		
1	EEPROM Data Error Flag	OFF: Normal	
		ON: Error occurred	
2	Reserved		
3	Reserved		
4	Reserved		
5	Reserved		
6	Reserved		
7	Reserved		
8	I/O Power Supply Status Flag	OFF: I/O power supply ON	
		ON: I/O power supply OFF	
9	Reserved		
10	Reserved		
11	Reserved		
12	Reserved		
13	Reserved		
14	Reserved		
15	Reserved		

4-3 I/O Wiring

4-3-1 Wiring to the Screwless Clamping Terminal Block

All of the GRT1-series Slice I/O Units can be wired with screwless clamp terminal blocks, which do not require screws to be tightened. When connecting a sensor or an external device, always crimp pin terminals to the cable of the sensor or device. The following table shows the compatible pin terminals.

Maker	Model number	Appropriate wire
Phoenix Contact	AI-0.5-10	0.5 mm ² (AWG 20)
	AI-0.75-10	0.75 mm ² (AWG 18)
	Al-1.5-10	1.25 mm ² (AWG 16)
Nihon Weidmuller	H 0.5/16 D	0.5 mm ² (AWG 20)
	H 0.75/16 D	0.75 mm ² (AWG 18)
	H 1.5/16 D	1.25 mm ² (AWG 16)

Pin Terminal Length

Use pin terminals with a pin (conductor) length of 9 to 11 mm.

Wiring to a Clamping Terminal Block

Insertion

Removal

Fully insert the pin terminal into any terminal hole.

Press the release button above the terminal hole with a slotted precision screwdriver and pull out the wire.

Note When pressing the release button, press with appropriate force (30 N max.). If excessive force is used, the terminal block may be damaged.

Use the following screwdriver or an equivalent to remove the wires.

Recommended Screwdriver

Model	Maker
SZF1	Phoenix Contact

4-4 Functions of Digital I/O Units

4-4-1 I/O Power Supply Monitor

Function Overview

This function is used to detect whether the I/O power is ON.

When the I/O power supply is turned OFF, the Basic Unit I/O Power Supply Status Flag or Expansion Unit I/O Power Supply Status Flag in the Status Area is turned ON. (Blt 4 of the Communications Unit's Status Flags will be ON.)

The Programming Device can be used to read the flag status.

Note The value for detecting a low voltage for the I/O power cannot be set.

Checking with a Programming Device

This example shows how to use the DeviceNet Configurator (version 2.43 or higher) to check the I/O power status monitor information.

- **1,2,3...** 1. Open the Network Configuration Window, right-click the Slice I/O Terminal's icon and display the Maintenance Information Window.
 - 2. Select the desired Slice I/O Unit and click the **View** Button. The Unit's Maintenance Information Window will be displayed. If the *Power Supply Error* Option is selected, it indicates that I/O power is not being supplied.

4-4-2 Input Filter (Input Units Only)

Function Overview

Input values can be read several times during a set interval so that the input value is enabled only when the value of all samples are the same. The input filter is applied to all of the inputs of the Unit.

ON Response Time

When input data changes to ON, the input data is read four times for the period of the set interval (1/4 of the ON response time). If all values are ON, the input is turned ON. The ON timing is delayed according to the length of the ON response time.

The input filter can also be used to perform an ON delay operation (a delay for the ON response time is created when the input filter is enabled).

OFF Response Time

When input data changes to OFF, the input data is read five times for the period of the set interval (1/5 of the OFF response time). If all values are OFF, the input is turned OFF. The OFF timing is delayed according to the length of the OFF response time.

The input filter can also be used for ON/OFF delay operations.

To use a pulse shorter than the communications cycle time, set the OFF response time to a value longer than the communications cycle time. (If the input pulse is short, the input may remain ON.)

Setting with a Programming Device

This example shows how to use the DeviceNet Configurator (version 2.43 or higher) to set the input filter.

- 1. Open the Network Configuration Window and double-click the desired Slice I/O Terminal's icon or right-click the icon and select Parameters *Edit* to display the Edit Device Parameters Window.
 - 2. Select the desired Slice I/O Unit from the list on the I/O Module Tab Page and click the **Edit** Button to display the Edit Unit Parameters Window.
 - 3. Select the **IN** Tab, input the desired values for the ON response time (in the *ON Delay* Field) and the OFF response time (in the *OFF Delay* Field), and click the **OK** Button.

	N Delay: 2ms F Delay: 16ms			
Sensor	Power ON Delay	C Enable		
No.	1/0 Comment	Detection	Value	
00	Sensor E3X-DA6 OMRON	Time	6000000

02	Sensor E3X-DA6 OMRON	Time	6000000	
03	Sensor E3X-DA6 OMRON	Time	6000000	

- 4. Click the General Tab.
- 5. Click the **Download** Button, and then click the **Reset** Button to reset the Unit.
- 6. Click the **OK** Button.

4-4-3 Sensor Power ON Delay (Input Units Only)

Function Overview When the I/O power has gone OFF, this function blocks inputs for the first 100 ms after the I/O power is turned back ON. The power ON delay allows the sensor power supply to stabilize and prevents false input signals caused by inrush current at startup. The Programming Device can be used to enable or disable this function.

Setting with a Programming Device

This example shows how to use the DeviceNet Configurator (version 2.43 or higher) to set the sensor power ON delay function.

- 1. Open the Network Configuration Window and double-click the desired Slice I/O Terminal's icon or right-click the icon and select Parameters *Edit* to display the Edit Device Parameters Window.
 - 2. Select the desired Slice I/O Unit from the list on the I/O Module Tab Page and click the **Edit** Button to display the Edit Unit Parameters Window.
 - 3. Select the **IN** Tab, select the *Enable* Option for the *Sensor Power ON Delay*, and click the **OK** Button.

	N Delay: 2ms FDelay: 16ms	- -		
Sensor	Power ON Delay	• Enable		
No.	1/0 Comment	Detection	Value	
00	Sensor E3X-DA6 OMRON	Time	6000000	
01	Sensor E3X-DA6 OMRON	Time	6000000	
02	Sensor E3X-DA6 OMRON	Time	6000000	
03	Sensor E3X-DA6 OMRON	Time	6000000	

- 4. Click the General Tab.
- 5. Click the **Download** Button, and then click the **Reset** Button to reset the Unit.
- 6. Click the **OK** Button.

4-4-4 Contact Operation Counter

Function Overview

The Contact Operation Counter is used to count the number of times each input or output contact has changed from OFF to ON (maximum resolution 50 Hz) and record the total value calculated in the Unit.

The monitor value can be set in the Unit, and when the set number of operations is reached, the Connected Device Maintenance Flag in the Status Area will be turned ON. (The Programming Device can be used to read the status of the Connected Device Maintenance Flag.)

- Counted operations: 0 to 4,294,967,295 operations (stored data: 00000000 to FFFFFFF hex)
- Counting unit: One operation

- **Note** 1. The Contact Operation Counter and Total ON Time Monitor cannot be used at the same time for a single contact. Select the function to be used in the *Detection Mode* Area.
 - 2. The Contact Operation Counter will not operate unless I/O power is being supplied.

Section 4-4

Setting with a Programming Device

This example shows how to use the DeviceNet Configurator (version 2.43 or higher) to set the Contact Operation Counter function.

- 1. Open the Network Configuration Window and double-click the desired Slice I/O Terminal's icon or right-click the icon and select Parameters *Edit* to display the Edit Device Parameters Window.
 - 2. Select the desired Slice I/O Unit from the list on the I/O Module Tab Page and click the **Edit** Button to display the Edit Unit Parameters Window.
 - 3. Select the **IN** Tab.

OFI	IDelay: 2ms Delay: 16ms	•

- 5. After checking that the setting for the monitor value is reflected in the Edit Unit Parameters Window, click the **General** Tab and click the **Download** Button.
- 6. Click the **OK** Button.
4-4-5 Total ON Time Monitor

Function Overview

The total ON time for each I/O contact can be calculated (unit: s) and recorded in the Unit. A monitor value can be set in the Unit, and when the total I/O contact ON time reaches the monitor value, the Connected Device Maintenance Flag in the Status Area is turned ON. (Bit 2 of the Communications Unit's Status Flags is turned ON.) The Programming Device can be used to read the status of the Connected Device Maintenance Flag.

- Measured time: 0 to 4,294,967,295 s (stored data: 00000000 to FFFFFFF hex)
- Measuring unit: s

- Note
- The Total ON Time Monitor and Contact Operation Counter cannot be used at the same time for a single contact. Select the function to be used in the *Detection Mode* Area.
 - 2. The Total ON Time Monitor operates when the I/O power is ON only.
 - The Total ON Time Monitor checks approximately every second whether the connected devices are ON.
 If the total ON time is calculated for ON times of less than a second, the measurement may not be accurate.

Measurement for ON Time of 0.5 s:

In *Figure 1*, the actual ON time is $0.5 \text{ s} \times 3 = 1.5 \text{ s}$. The measurement will be taken once during this ON time, so the total ON time will be measured as 1 s.

Reading taken approximately every second.

Figure 1

In *Figure 2*, the actual ON time is $0.5 \text{ s} \times 3 = 1.5 \text{ s}$. The reading will be taken twice during this ON time, so the total ON time will be measured as 2 s.

Figure 2

■ <u>Measurement for ON time of 1.5 s:</u>

In *Figure 3*, the actual ON time is $1.5 \text{ s} \times 2 = 3 \text{ s}$. The measurement will be taken four times during this ON time, so the total ON time will be measured as 4 s.

Reading taken approximately every second.

Setting with a Programming Device

This example shows how to use the DeviceNet Configurator (version 2.43 or higher) to set the Total ON Time Monitor function.

- 1,2,3... 1. Open the Network Configuration Window and double-click the desired Slice I/O Terminal's icon or right-click the icon and select Parameters *Edit* to display the Edit Device Parameters Window. Select the desired Slice I/O Unit from the list on the *I/O Module* Tab Page and click the Edit Button to display the Edit Unit Parameters Window.
 - 2. Select the IN Tab.

- 4. After checking that the setting for the monitor value is reflected in the Edit Unit Parameters Window, click the **General** Tab, and click the **Download** Button.
- 5. Click the **OK** Button.

4-4-6 Operation Time Monitor

Function Overview This function can measure and monitor the time between the ON/OFF transitions of two bits. The Unit's starting and ending bits can be selected freely. The trigger edge ($ON \rightarrow OFF$ or $OFF \rightarrow ON$), and input or output numbers can be selected freely, providing flexibility when testing. A monitor value can be set in the Unit to monitor the operating time, and turn ON a warning flag in the Status Area when the set value is reached. A monitor value can be set in the Unit, and when the operating time exceeds the monitor value, the Operation Time Monitor Flag in the Status Area is turned ON. (Bit 2 of the Communications Unit's Status Flags is turned ON.) The Programming Device can be used to read the status of the flag.

Setting with a This example shows how to use the DeviceNet Configurator (version 2.43 or higher) to set the Operation Time Monitor function.

- 1,2,3... 1. Open the Network Configuration Window and double-click the desired Slice I/O Terminal's icon or right-click the icon and select Parameters *Edit* to display the Edit Device Parameters Window. Select the desired Slice I/O Unit from the list on the *I/O Module* Tab Page and click the Edit Button to display the Edit Unit Parameters Window.
 - 2. Select the **Operation Time** Tab.

0.	Equipment Name	Operation	Start Point	End Point	Edge Patt

Tabs in the Maintenance Information Window

General Tab Page

Item	Description
Comment	Displays up to 32 characters of text set as the Unit comment.
Last Maintenance Date	Displays the last maintenance date that was set.
Unit Conduction Time	Displays the total time that the Unit has been ON (cumulative power ON time).
Update Button	Click this Button to update the Maintenance information.
Save Maintenance Counter	This function saves the maintenance counter value in the Unit. If this function is used, the previous value will be retained when the power supply is turned OFF and ON again.

Status Check Boxes for Status Flags

The flags shown in the following table will be turned ON when the corresponding error occurs.

ltem	Description
Unit Maintenance	ON when the total Unit ON time exceeds the set value.
Connected Device Maintenance	ON when any I/O point's Total ON Time Monitor or Contact Operation Counter exceeds its user-set monitor value.
Operation Time Monitor	ON when the measured operation time exceeds the user-set monitor value.
I/O Power Supply Error	ON when the input power supply is OFF.
EEPROM data error	ON when the data contained in EEPROM is invalid.

5-1 Overview of Analog I/O Units

This section provides an overview of Analog I/O Units, including details on functions and setting methods for each Unit.

5-1-1 Analog I/O Units

In addition to the functions common to the GRT1 Series (backup, restore, online conversion, etc.), other functions specific to Analog I/O Units (scaling, peak/bottom hold, etc.) are available. Analog Input Units are also able to internally perform math on analog input values, which previously required ladder programming in the host PLC. Analog data can be selected from the six values obtained from math operations and allocated as I/O in combination with Generic Status Flags or other status information. The Setting Tool can be used to allocate this status data, and to set functions specific to Monitor/Analog I/O Units and perform monitoring.

5-1-2 Comparison with Earlier Models

Analog Input Units

Unit		GRT1 Series	DRT2 Series		
Model		GRT1-AD2	DRT2-AD04		
Analog points		2 inputs	4 inputs		
Input range (signa	ls)	0 to 5 V, 1 to 5 V, 0 to 10 V, –10 to 10 V, 0 to 20 mA, 4 to 20 mA			
AD conversion cycle		2 ms/2 points	By setting the number of conversion points (1 to 4 points), the conversion cycle can be shortened (e.g., 4 points: 4 ms max.)		
			Note The conversion cycle will be slightly different when the math operations are used.		
AD conversion dat	а	0 to 5 V, 1 to 5 V, 0 to 10 V, 0 to 20 mA,	4 to 20 mA: 0000 to 1770 hex		
		-10 to 10 V: F448 to 0BB8 hex			
		Note Two's complement			
Resolution		1/6,000 (full scale)			
Unit power supply		Supplied from slice bus.	Supplied from communications power supply.		
Communications power supply cur- rent consumption		None	90 mA max.		
Overall accuracy	25°C	Voltage input: ±0.3% FS; Current input: ±0.4% FS			
	–10 to 55°C	Voltage input: ±0.6% FS; Current input:	±0.8% FS		
Allocated I/O data		Default: Analog input values for 2 points The Setting Tool can be used to allo- cate peak value, bottom value, top value, valley value, rate of change, comparator results, etc.	Default: Analog input values for 4 points The DeviceNet Configurator can be used to allocate peak value, bottom value, top value, valley value, rate of change, comparator results, Generic Status Flags, etc.		
Input switching (Sets number of AD conversion points)		Supported. (Set using DIP switch: Select either 1 or 2 points)	Supported (Set using DeviceNet Con- figurator: Select from 1 to 4 points)		
Input range switching		Using DIP switch: Inputs 0 and 1 share setting. Using Setting Tool: Can be set sepa- rately.	 Using DIP switch: Inputs 0 and 1 share setting, Inputs 2 and 3 share setting. Using DeviceNet Configurator: Inputs 0 to 3 set separately. 		
Node address setting		No setting required.	Set using the rotary switches or the DeviceNet Configurator.		

Unit	GRT1 Series	DRT2 Series
Model	GRT1-AD2	DRT2-AD04
Baud rate setting	No setting required.	Automatically detected: Uses baud rate set for Master Unit.
Moving average	Supported. (Set using Setting Tool.)	Supported. (Set using DeviceNet Con- figurator.)
Off-wire detection	Supported.	
Scaling, offset compensation, peak/ bottom hold, top/valley hold, rate of change operations, comparator, user adjustment (maintenance func- tion), cumulative counter (mainte- nance function), last maintenance date (maintenance function)	Supported. (Set using Setting Tool.)	Supported. (Set using DeviceNet Con- figurator.)

Analog Output Units

Unit		GRT1 Series		DRT2 Series
Model		GRT1-DA2V	GRT1-DA2C	DRT2-DA02
		(Voltage Output)	(Current Output)	
Analog points		2 outputs		
Output signal rang	е	0 to 5 V, 1 to 5 V, 0 to 10 V, -10 to 10 V	0 to 20 mA, 4 to 20 mA	0 to 5 V, 1 to 5 V, 0 to 10 V, -10 to 10 V, 0 to 20 mA, 4 to 20 mA
Conversion time		2 ms/2 points	•	
DA conversion data		0 to 5 V, 1 to 5 V, 0 to 10 V: 0000 to 1770 hex	0 to 20 mA, 40 to 20 mA: 0000 to 1770 hex	0 to 5 V, 1 to 5 V, 0 to 10 V, 0 to 20 mA, 4 to 20 mA: 0000 to 1770 hex
		-10 to 10 V: F448 to 0BB8 hex	Note Two's Complement	-10 to 10 V: F448 to 0BB8 hex
		Note Two's complement		Note Two's complement
Resolution		1/6,000 (full scale)		•
Unit power supply		Supplied by slice bus.		Supplied by communications power supply.
Communications power sup- ply current consumption		None		120 mA max.
Overall accuracy	25°C	±0.4% FS	$\pm 0.4\%$ FS (See note.)	Voltage output: ±0.3% FS, Cur- rent output: ±0.4% FS
	–10 to 55°C	±0.8% FS	±0.8% FS (See note.)	Voltage output: ±0.6% FS, Cur- rent output: ±0.8% FS
Data allocated in I/O		Only Analog output values for 2 outputs		Default: Analog output values for 2 points
				The DeviceNet Configurator can be used to allocate Generic Status Flags.
Output range switching		Set using the DIP switch or Setting Tool.		Set using the DIP switch or the DeviceNet Configurator.
Node address setting		No setting required.		Set using the rotary switches or the DeviceNet Configurator.
Baud rate setting		No setting required.		Automatically detected: Uses the baud rate set for the Master Unit.
Communications error output		Set using the Setting Tool.		Set using the DeviceNet Configurator.
Scaling, user adjustment (maintenance function), cumu- lative counter (maintenance function), last maintenance date (maintenance function)		Supported. (Set using the	Setting Tool.)	Supported. (Set using the DeviceNet Configurator.)

Note	In 0- to 20-mA mode, accuracy cannot be ensured at 0.2 mA or less.
------	--
5-1-3 List of Data Processing Functions

The following tables list the data processing functions that can be used with Analog I/O Units. Refer to *5-4-3 Functions and Settings* for details on functions and setting methods.

GRT1-AD2 Analog Input Units

Function	Details	Default
Moving average	Calculates the average of the past eight analog input values, and produces a stable input value even when the input value is unsteady.	Moving average disabled.
Setting the number of AD conversion points	By reducing the number of input conversion points, the conversion cycle speed can be increased. For details, refer to 5-4-4 Calculating the Conversion Cycle.	2-point conversion
Scaling	Performs scaling. Scaling allows conversion of values between 0 and 6,000 into values using the industry unit required by the user. It reduces the number of operations requiring ladder program- ming in the Master CPU Unit. Scaling also supports an off- set function for compensating for mounting errors in sensors and other devices.	0 to 6,000
Peak/bottom hold	Holds the maximum and minimum analog input values.	Disabled
Top/valley hold	Holds the top and valley values for analog input values.	Disabled
Rate of change	Calculates the rate of change for analog input values.	Disabled
Comparator	Compares the analog input value or an analog value after math processing (i.e., value for peak, bottom, top, valley, rate of change) with the four set values HH, H, L, and LL, and indicates the result with the Analog Status Flags.	Disabled
Off-wire detection	Detects disconnections of analog inputs. (Valid only for the input ranges 4 to 20 mA and 1 to 5 V)	Enabled
User adjustment	Adjusts the input when an offset occurs in the input voltage or current.	Disabled
Cumulative counter	Calculates an approximation to the integral of analog input values over time.	Disabled
Last maintenance date	Records the date of the last maintenance in the Unit.	2005/1/1

GRT1-DA2V/GRT1-DA2C Analog Output Units

Function	Details	Default
Scaling	Performs scaling. Scaling allows conversion of values between 0 and 6,000 into values using the industry unit required by the user. It reduces the number of operations required in ladder pro- gramming in the Master.	Disabled (0 to 6,000)
User adjustment	Adjusts the output when an offset occurs in the output volt- age or current.	Disabled
Cumulative counter (main- tenance function)	Calculates an approximation to the integral of analog output values over time.	Disabled
Error output value setting	Sets the value output when a communications error occurs for each output.	Low limit
Last maintenance date	Records the date of the last maintenance in the Unit.	2005/1/1

5-1-4 Data Processing Flowcharts (Analog Input Units)

The following math operations can be performed on the external analog input value. The values obtained after processing (analog input values) can be allocated as I/O for the Master.

- Scaling to desired industry unit
- Moving average processing

Other Operation Results After moving average and scaling processing, the analog input value can be processed using the following operations. The values after processing are called peak value, bottom value, top value, valley value, rate of change, and cumulated value.

- Peak/hold operation
- Top/valley operation
- Rate of change operation
- Cumulative operation (maintenance function)

Analog processing is performed according to the following flowchart.

5-1-5 Selecting Data (Analog Input Units)

After performing math operations, select up to two of the six resulting values to allocate as I/O, from the analog input value, peak value, bottom value, top value, valley value, and rate of change. The selected data is referred to as "analog data" and can be allocated for the Master individually or in combination with Status Flags. The data is selected using the Setting Tool. Comparison operations (comparator function) with four alarm set values can be performed for analog data.

Flow of Data in Analog Input Units

Note By default, analog input values are allocated as I/O just as they are.

For Inputs 0 and 1, analog data can be separately selected, as shown in the following diagram.

5-1-6 I/O Data

GRT1-AD2 Analog Input Units

Analog Input Units support the following four types of input data, and one type of output data. The required data can be allocated for use as I/O.

Input Data

I/O data	Details	
Analog Data (4 input bytes)	 Used to monitor analog data. Select one type of data from analog input value, peak value, bottom value, top value, value, value, or rate of change. (Default allocation: Analog input value) 	
	Note The comparator can be used with analog data.	
Top/Valley Detection Timing Flags (2 input bytes)	Top/Valley Detection Timing Flags are allocated in one word. These flags are allocated together with the top value or valley value and are used to time reading the values held in the Master.	
Analog Status Flags (2 input bytes)	Used to allocate the bits for the Comparator Result Flags, Top/Valley Detection Timing Flags, and Off-wire Detection Flag. The function of each bit is as follows:	
	 Comparator Result Flags Allow control of the judgement results only, without allocating analog values Top/Valley Detection Timing Flags Used to time reading the values held as the top and valley values when both the top and value values are allocated at the same time. 	
	 Off-wire Detection Flags Disconnections can be detected even when the analog values are not allocated. 	
Analog Data + Top/Valley Detection Timing Flags (6 input bytes)	Allocation of Analog Data (4 bytes) followed by Top/Valley Detection Timing Flags (2 input bytes)	

Output Data

I/O data	Details
Hold Flags (1 output byte)	Used with each of the hold functions (peak, bottom, top, and valley) to control the execu- tion timing of hold functions from the Master.
GPT1-DA2 Analog	Appleg Output Units support and type output data. Allocate the required data

Output Units

Analog Output Units support one type output data. Allocate the required data as shown in the following tables.

Output Data

Data Type	Details
Output data (4 output bytes)	Used to allocate analog output data.

5-2 Status Areas

An Analog I/O Unit has two internal Status Areas. Bits are set with respect to thresholds set by the user for each function. When any bit turns ON in one of these Status Areas, the relevant Communications Unit Status Flag turns ON. The Master Unit is notified of the status of Communications Unit Status Flags. Information in I/O Unit Status Areas can be read using the Setting Tool.

turns ON, the relevant Communications Unit Status Flag turns ON.

GRT1-AD2

Warning Status Area

The Analog Input Unit's Warning Status Area is configured of the following 16 bits. The Warning Status Area provides notification of minor errors detected in the Unit.

Bit	Contents	Description
0	Reserved.	
1	Reserved.	
2	Reserved.	
3	Unit Maintenance Flag OFF: Normal; ON: Error (over threshold)	Monitors the power-ON time set as the threshold for the Unit conduction time monitoring function.
4	Reserved.	
5	Reserved.	
6	Reserved.	
7	Reserved.	
8	Analog Range Flag OFF: Within range (below monitoring set value) ON: Out of range (at or above monitoring set value)	Turns ON when the analog data exceeds the range that can be dis- played or the monitoring value set for the monitor function.

Bit	Contents	Description
9	Cumulative Counter Flag	Turns ON when the cumulative value
	OFF: Within range (below monitoring set value)	exceeds the monitoring set value.
	ON: Out of range (at or above monitoring set value)	
10	Reserved.	
11	Reserved.	
12	Reserved.	
13	Reserved.	
14	Reserved.	
15	Reserved.	

Alarm Status Area

The Analog Input Unit's Alarm Status Area is configured of the following 16 bits. The Alarm Status Area provides notification of serious errors detected in the Unit.

Bit	Contents	Description
0	Reserved.	
1	EEPROM data error	OFF: Normal; ON: Error
2	Reserved.	
3	Reserved.	
4	Reserved.	
5	Reserved.	
6	Reserved.	
7	Reserved.	
8	Off-wire Detection Flag	OFF: Normal; ON: Disconnection
9	Analog hardware error	OFF: Normal; ON: Error in analog hard- ware
10	Reserved.	
11	Reserved.	
12	Reserved.	
13	Reserved.	
14	Reserved.	
15	Reserved.	

GRT1-DA2

Warning Status Area

The Analog Output Unit's Warning Status Area is configured of the following 16 bits. The Warning Status Area provides notification of minor errors detected in the Unit.

Bit	Contents	Description
0	Reserved.	
1	Reserved.	
2	Reserved.	
3	Unit Maintenance Flag OFF: Normal; ON: Error (over threshold)	Monitors the power-ON time set as the threshold for the Unit conduction time monitoring function.
4	Reserved.	
5	Reserved.	
6	Reserved.	
7	Reserved.	

Bit	Contents	Description
8	Error Output Flag	ON while error is being output.
	OFF: Normal; ON: Error being output	
9	Cumulative Counter Flag	Turns ON when the cumulative value
	OFF: Within range (below monitoring set value)	exceeds the monitoring set value.
	ON: Out of range (at or above monitoring set value)	
10	Reserved.	
11	Reserved.	
12	Reserved.	
13	Reserved.	
14	Reserved.	
15	Reserved.	

Alarm Status Area

The Analog Output Unit's Alarm Status Area is configured of the following 16 bits. The Alarm Status Area provides notification of serious errors detected in the Unit.

Bit	Contents	Description
0	Reserved.	
1	EEPROM data error	OFF: Normal; ON: Error
2	Reserved.	
3	Reserved.	
4	Reserved.	
5	Reserved.

8	Reserved.	
9	Analog hardware error	OFF: Normal; ON: Error in analog hard- ware
10	Reserved.	
11	Reserved.	
12	Reserved.	
13	Reserved.	
14	Reserved.	
15	Reserved.	

5-3 Maintenance Information Window

This section describes the Maintenance Information Window, which can be used to monitor the status of Analog I/O Units. The Monitor Device Window can be used to check the same Unit status information, but the examples in this section use the Maintenance Information Window.

5-3-1 Checking Maintenance Information

There are two ways to check maintenance information. One way is to rightclick in the Main Window of the Setting Tool and select *Maintenance Information*. The other way is to double-click the Unit in the Maintenance Mode Window, click the **I/O Module** Tab, select the desired Unit, and click the **View** Button to display the Maintenance Information Window of the I/O Unit.

Display Area

ltem	Description
I/O Comment	Displays up to 32 characters of text as a comment. A separate comment can be set for each input.
Last Maintenance Date	Displays the last maintenance date and time. (All models.)
Present Value	Displays the present analog value. (All models.)
	Displays data derived from the analog value, including the Peak Value, Bottom Value, Top Value, Valley Value, Rate of Change, Cumulated Count, Maximum Value, and Minimum Value.
	For details, refer to the descriptions of individual functions and setting methods.

Status Check Boxes

■ All Analog I/O Unit Models

Item	Description
Threshold Cumula- tive Counter Over	On when the cumulative counter value exceeds the set value.
Cumulative Counter Overflow	ON when there is an overflow in the cumulative counter value.
Cumulative Counter Underflow	ON when there is an underflow in the cumulative counter value.

■ GRT1-AD2

ltem	Description
Over Range/Under Range	ON when the analog data is above or below the displayable range.
Alarm Over/Warning Over	ON when the analog data is above or below the monitoring set values set in the comparator function.
Broken wire	ON when a wire is broken or disconnected. (Used only for Analog Input Units when the input range is 1 to 5 V or 4 to 20 mA.)

Error History Window

For details on the Error History Window, refer to 4-5-1 Checking Maintenance Information.

5-4 Analog Input Units

5-4-1 GRT1-AD2 Analog Input Units

General Specifications

Item	Specifications
Unit power supply voltage	24 V DC (24 V DC –15% to +10%)
I/O power supply voltage	I/O power supply not required.
Noise immunity	Conforms to IEC 61000-4-4. 2.0 kV (power lines)
Vibration resistance	10 to 60 Hz, 0.7-mm double amplitude, 60 to 150 Hz, 50 m/s ²
Shock resistance	150 m/s ²
Dielectric strength	500 V AC for 1 min. with 1-mA sensing current (between isolated circuits)
Ambient temperature	-10 to 55°C (with no icing or condensation)
Ambient humidity	25% to 85%
Operating environment	No corrosive gases

Analog Input Units

ltem	Specifications
Storage temperature	-25 to 65°C (with no icing or condensation)
Mounting	35-mm DIN Track mounting

Performance Specifications

Item		Specifications			
		Voltage input	Current input		
Input points		2 points (inputs 0 to 1)	2 points (inputs 0 to 1)		
Input signal range		0 to 5 V	0 to 20 mA		
		1 to 5 V	4 to 20 mA		
		0 to 10 V			
		-10 to 10 V

	-10 to 55°C	±0.6% FS	±0.8% FS		
Analog conversion cy	nalog conversion cycle 2 ms max./2 points (when math operations are not used)		ons are not used)		
AD conversion data		-10 to 10 V range: F448 to 0BB8 hex full scale (-3,000 to 3,000)			
		Other ranges: 0000 to 1770 hex full scale (0 to 6,000)			
		AD conversion range: $\pm 5\%$ FS of the above data ranges.			
Isolation method		Photocoupler isolation (between input and communications lines)			
		No isolation between input signal wires			
I/O connection method Sc		Screwless Terminal block			

Names and Functions of Parts

Setting the Input Range

Setting with the DIP Switch The input signal range can be set using the DIP switch or the Setting Tool.

Each pin is set according to the following table.

Pin No.	Setting	Specifications
1	Input Terminal: Input range set-	Default setting: All pins OFF
2	ting for Inputs 0 and 1.	
3		
4	Input range setting method	OFF: Set using Setting Tool.
		ON: Set using DIP switch. (The DIP switch settings are disabled when this pin is OFF, i.e., when the Setting Tool is used.)
		Note Default setting: OFF

Note 1. Always set pin 4 to ON if the DIP switch is to be used to set the ranges. If this pin is OFF, the DIP switch settings will not be enabled.

2. The DIP switch settings are read when the power is turned ON.

Input Range Settings

Inputs 0 and 1 (Shared Setting)

Input range	Pin 1	Pin 2	Pin 3
0 to 5 V	OFF	OFF	OFF
1 to 5 V	ON	OFF	OFF
0 to 10 V	OFF	ON	OFF
-10 to 10 V	ON	ON	OFF
4 to 20 mA	OFF	OFF	ON
0 to 20 mA	ON	OFF	ON
Cannot set for other ranges.			

Setting Tool Procedure (Example: DeviceNet Configurator)

- In the Network Configuration Window for the Slice I/O Terminal, doubleclick the icon of the Slice I/O Terminal that is to be set. Alternatively, rightclick the icon and select *Parameters - Edit*. The Edit Device Parameters Window will be displayed.
 - 2. Click the I/O Module Tab.
 - 3. Click the **Edit** Button on the *I/O Module* Tab Page. The Edit Unit Parameters Window will be displayed.
 - 4. Select the tab page for the input where the range is to be changed.
 - 5. Select the desired range from the pull-down menu in the *Input Range* Field.

NOTE! Input Range isn't enabled only by changing this parameter.	Default : 0 - 5V

- 6. Return to the *General* Tab Page, click the **Download** Button, and then click the **Reset** Button to reset the Unit.
- 7. Click the **OK** Button to exit the window.

Internal Circuits

Wiring

Connect the terminals of the Analog Input Unit for each Input Unit according to the following diagrams, depending on whether a voltage input or a current input is being used.

For current input, use the accessory tool to short-circuit the SHTOA and SHTOB terminals together.

Note Do not wire the RSV terminal. This terminal is used to connect an internal signal for heat radiation.

Input Range and Conversion Data

The analog data that is input will be converted to digital data according to the input range, as described here. If the input exceeds the input range, the AD conversion data will be fixed at the upper or lower limit.

Input Range: 0 to 5 V

The voltage range 0 to 5 V corresponds to 0000 to 1770 hex (0 to 6,000). The convertible data range is FED4 to 189C hex (-300 to 6,300). Negative voltages are expressed as two's complements (16 bits). When a disconnection occurs, the data equivalent to 0 V input will be used (0000 hex).

■ Input Range:1 to 5 V

The voltage range 1 to 5 V corresponds to 0000 to 1770 hex (0 to 6,000). The convertible data range is FED4 to 189C hex (-300 to 6,300). If the input voltage falls below the input range (input voltage less than 0.76 V), a disconnection is detected and the data is set to 7FFF hex.

Input Range: 0 to 10 V

The voltage range 0 to 10 V corresponds to 0000 to 1770 hex (0 to 6,000). The convertible data range is FED4 to 189C hex (-300 to 6,300). Negative voltages are expressed as two's complements (16 bits). When a disconnection occurs, the data equivalent to 0 V input will be used (0000 hex).

Input Range: –10 to 10 V

The voltage range -10 to 10 V corresponds to F448 to 0BB8 hex (-3,000 to 3,000). The convertible data range is F31C to 0CE4 hex (-3,300 to 3,300). Negative voltages are expressed as two's complements (16 bits). When a disconnection occurs, the data equivalent to 0 V input will be used (0000 hex).

■ Input Range: 0 to 20 mA

The current range 0 to 20 mA corresponds to 0000 to 1770 hex (0 to 6,000). The convertible data range is FED4 to 189C hex (-300 to 6,300). Negative currents are expressed as two's complements (16 bits). When a disconnection occurs, the data equivalent to 0 mA input will be used (0000 hex).

Input Range: 4 to 20 mA

The current range 4 to 20 mA corresponds to 0000 to 1770 hex (0 to 6,000). The convertible data range is FED4 to 189C hex (-300 to 6,300). If the input current is below the input range (input current less than 3.04 mA), a disconnection is detected and the data is set to 7FFF hex.

AD Conversion Data

Negative AD conversion data is expressed as two's complements. The NEG instruction (two's complement conversion) can be used to obtain the absolute value of the two's complement.

Conversion Speed

The AD conversion data for 2 input points is refreshed every 2.42 s max., although the conversion speed will vary depending on the functions and number of AD conversion points being used. Refer to 5-4-4 Calculating the Conversion Cycle for details.

5-4-2 I/O Data Allocation Methods

Selecting I/O Data to be Allocated

Use one of the following methods to select data for allocating in the Communications Unit and then perform remote I/O communications.

- *1,2,3...* 1. Use the default settings. Input analog values only will be allocated as I/O.
 - 2. Use the Setting Tool to Allocate data. Aside from input analog values, data can be allocated in combination with Status Flags.

When the Default Settings Are Used

When the Analog Input Unit's default settings are used, only the analog input values are selected as I/O data and allocated in the two words (four bytes) of the Master's Input Area, as shown in the following diagram.

^

	-
1	Э

15		U
	Analog Input Value for Input 0	
	Analog Input Value for Input 1	

Allocating Data (Example: DeviceNet Configurator)

Analog data is combined with other data such as Status Flags as shown below, and allocated as I/O. By using the Setting Tool, it can be selected from a pull-down list.

Example: Allocating Analog Data + Top/Valley Detection Timing Flags

15	8	7 0)			
	Analog Data for Input 0					
	Analog Data for Input 1					
	Top Detection Timing Flag	Valley Detection Timing Flag				

The DeviceNet Configurator can be used as described below to allocate data.

Setting Procedure (Example: DeviceNet Configurator)

- In the Network Configuration Window for the Slice I/O Terminal, doubleclick the icon of the Slice I/O Terminal that is to be set. Alternatively, rightclick the icon and select *Parameters - Edit*. The Edit Device Parameters Window will be displayed.
 - 2. Click the I/O Module Tab.

- 5. Return to the *General* Tab Page, click the **Download** Button, and then click the **Reset** Button to reset the Unit.
- 6. Click the OK Button to exit.

Selecting the Analog Data Type

The analog data type can be selected from up to six types of data (analog input value, peak value, bottom value, top value, valley value, and rate of change) obtained from math operations. The selected data can be allocated for the Master either individually or in combination with Status Flags.

Use the following method to select the analog data type.

Selecting the Analog Data (Example: DeviceNet Configurator)

- In the Network Configuration Window for the Slice I/O Terminal, doubleclick the icon of the Slice I/O Terminal that is to be set. Alternatively, rightclick the icon and select *Parameters - Edit*. The Edit Device Parameters Window will be displayed.
 - 2. Click the **Edit** Button on the *I/O Module* Tab Page. The Edit Unit Parameters Window will be displayed.

3. Open the tab page for the input for which analog data is to be selected, and select from the pull-down list the type of data to be allocated to Analog Data.

- 4. Return to the *General* Tab Page, click the **Download** Button and then click the Reset Button to reset the Unit.
- 5. Click the **OK** Button to exit.

I/O Data

Analog Data

Analog data is used to monitor analog values. Analog input value is allocated as the default setting, but any one of analog input value, peak value, bottom value, top value, valley value or rate of change can be selected as allocation data.

Note The comparator function can be used for the data allocated in Analog Data.

The data format used for allocating data in the Master is shown below. Data is allocated as two's complements (4 bytes = 2 words).

15		0
	Analog Data for Input 0	
	Analog Data for Input 1	

Top/Valley Detection Timing Flags (Shot Status)

These flags turn ON for the one-shot time when detecting the top or valley for the top/valley hold function.

These flags are used to time reading the values held as the top and valley values at the Master. The following data format is used when these flags are allocated in the Master (2 bytes/1 word).

	Bit 7	Bit 6	Bit 5	Bit 4	Bit 3	Bit 2	Bit 1	Bit 0
+0	0	0	0	0	0	0	V_ST1	V_ST0
+1	0	0	0	0	0	0	T_ST1	T_ST0

Byte	Abbreviation	Name	Details
+0	V_STx	Valley Detection Tim- ing Flag	Turns ON when a valley is detected by the valley hold function and then turns OFF after the one-shot time has elapsed.
+1	T_STx	Top Detection Timing Flag	Turns ON when a top is detected by the top hold func- tion and then turns OFF after the one-shot time has elapsed.

Note The one-shot time can be changed. For details, refer to the one-shot time settings for the top/valley hold function.

The Analog Status Flags include allocations for the Comparator Result Flag, the Top/Valley Detection Timing Flags, and the Off-wire Detection Flags. These flags are used for detection and monitoring.

The data format used for each byte when these flags are allocated in the Master is shown below (2 bytes/1 word).

0	10		
	LU	LL0	Input
	1.4		0
.1	L1	LL1	Input 1
.1	L1		LL1

The details for each bit are shown in the following table.

Bit	Abbrevi- ation		Name	Details
0	LLx	Compara- tor result	Low Low Limit Alarm Flag	Turns ON when the value of data allocated in Analog Data drops below the Low Low Limit alarm setting.
1	Lx		Low Limit Alarm Flag	Turns ON when the value of data allocated in Analog Data drops below the Low Limit alarm setting.
2	PSx		Normal Flag (pass signal)	Turns ON when none of the alarms (High High Limit, High Limit, Low Low Limit, and Low Limit) have been output.
3	Hx		High Limit Alarm Flag	Turns ON when the value of data allocated in Analog Data exceeds the High Limit alarm setting.
4	HHx		High High Limit Alarm Flag	Turns ON when the value of data allocated in Analog Data exceeds the High High Limit alarm setting.

Analog Status Flags (Analog Status)

Analog Input Units

	Bit	Abbrevi- ation	Name		Details
5		V_STx	Top/val- ley detec-	Valley Detec- tion Timing Flag	Used with the valley hold func- tion.
			tion timing		Turns ON when a valley is detected, and turns OFF after the one-shot time has lapsed.
6		T_STx		Top Detection	Used with the top hold function.
				Timing Flag	Turns ON when a top is detected, and turns OFF after the one-shot time has lapsed.
7		BWx	Off-wire Detection Flag		Turns ON when a disconnection is detected.

Analog Data + Top/Valley Detection Timing Flags (Analog Data + Shot Status) This data pattern consists of Analog Data followed by the Top/Valley Detection Timing Flags and is allocated in the Master using the following data format (6 bytes/3 words).

	Bit 7	Bit 6	Bit 5	Bit 4	Bit 3	Bit 2	Bit 1	Bit 0
+0			An	alog Dat	a for Inpu	it 0		
+1								
+2		Analog Data for Input 1						
+3								
+4	0	0	0	0	0	0	V_ST1	V_ST0
+5	0	0	0	0	0	0	T_ST1	T_ST0

Hold Flags (Output) Hold Flags are used with the peak/bottom hold and top/valley hold functions. The Hold Flags are used to control the hold execution timing from the Master and are allocated in the Master using the following data format (2 bytes).

Note A delay may occur between when the Master's power is turned ON until notification of the Hold Flag status is sent to the Unit.

	Bit 7	Bit 6	Bit 5	Bit 4	Bit 3	Bit 2	Bit 1	Bit 0	
+0							HD1	HD0	
+1]

The details for each bit are shown in the following table.

Bit	Abbreviation	Name	Details
0	HD0	Hold Flag for Input 0	The hold function is performed for Ana- log Input 0 while this flag is ON. The hold function stops and the last value is held when the flag goes OFF.
1	HD1	Hold Flag for Input 1	The hold function is performed for Ana- log Input 1 while this flag is ON. The hold function stops and the last value is held when the flag goes OFF.

5-4-3 Functions and Settings

Setting the Number of AD Conversion Points Normally, when using a two-point Input Unit, the values for the two inputs are converted in sequence. The setting can be changed, however, so that unused inputs are not converted. By reducing the number of conversion points, the

Conversion points	Details
2 points (default)	Converting Inputs 0 to 1.
	GRT1-AD2
1 point	Converting Input 0.
	GRT1-AD2 0 1 1 Input 0 only used.

conversion cycle speed is increased. For details on conversion cycle time, refer to 5-4-4 Calculating the Conversion Cycle.

Note Two words are always used for the I/O data for analog input values regardless of the analog word setting.

Setting Procedure (Example: DeviceNet Configurator)

 In the Network Configuration Window for the Slice I/O Terminal, doubleclick the icon of the Analog Input Unit that is to be set. Alternatively, rightclick the icon and select *Parameters - Edit*. The Edit Device Parameters Window will be displayed. 2. Click the I/O Module Tab.

Section 5-4

Moving Average Processing

This function calculates the average value (moving average) of the previous eight inputs, and uses the resulting value as conversion data. When the input value fluctuates frequently, averaging can be used to produce a stable input value, as shown in the following diagram.

Setting Procedure (Example: DeviceNet Configurator)

- In the Network Configuration Window for the Slice I/O Terminal, doubleclick the icon of the Analog Input Unit that is to be set. Alternatively, rightclick the icon and select *Parameters - Edit*. The Edit Device Parameters Window will be displayed.
 - 2. Click the I/O Module Tab.
 - 3. Click the **Edit** Button on the *I/O Module* Tab Page. The Edit Unit Parameters Window will be displayed.
 - 4. Select the tab page for the input where moving average processing is to be performed, and select the *Moving Average* Check Box in the *Function Choice* Area.

RESET or re-start is required.	

- 5. Return to the *General* Tab Page, click the **Download** Button, and then click the **Reset** Button to reset the Unit.
- 6. Click the **OK** Button to exit.

Scaling

The default setting is used to perform AD conversion of analog input values, scaling them to a count between 0 and 6,000. Scaling can be used to change scaled values that correspond to the input signal range into other values required by the user (industry unit values). Scaling also eliminates the need

for ladder programming in the Master to perform math operations. The following two methods of input scaling can be used.

Default Scaling Analog input values (count values) are converted to the original voltage and current values. The units used are mV or μA. When default scaling is selected, scaling is performed according to the range used, as shown in the following table.

Input range	0 to 5 V	0 to 10 V	1 to 5 V	-10 to 10 V (AD04 only)	0 to 20 mA	4 to 20 mA
100%	5,000 mV	10,000 mV	5,000 mV	10,000 mV	20,000 µA	20,000 µA
0%	0000 mV	0000 mV	1,000 mV	–10,000 mV	0000 μΑ	4,000 μΑ
Off-wire			7FFF hex			7FFF hex

User Scaling

Analog input values (count values) are scaled to user-defined values. The conversion values for 100% and 0% are set using the Setting Tool.

Input range	0 to 5 V	0 to 10 V		-10 to 10 V (AD04 only)	0 to 20 mA	4 to 20 mA
100%	Set using Setting Tool (-28,000 to 28,000)					
0%	Set using Setting Tool (-28,000 to 28,000)					
Off-wire			7FFF hex			7FFF hex

- **Note** Reverse scaling, where the 0% scaling value is higher than the 100% scaling value, is also supported.
- Offset Compensation Scaling analog input values of Linear Sensors to distances produces mounting error in the Sensor. Offset compensation compensates for error that occurs during scaling. The offset amount is added to the scaled line before processing, as shown in the following diagram. The offset (error) value can be input between -28,000 to 28,000, but make sure that underflow or overflow does not occur. The High Limit is 7FFE hex and the Low Limit is 8000 hex.
 - **Note** The offset value can be set even when using default scaling.

Setting Procedure (Example: DeviceNet Configurator)

- In the Network Configuration Window for the Slice I/O Terminal, doubleclick the icon of the Analog Input Unit that is to be set. Alternatively, rightclick the icon and select *Parameters - Edit*. The Edit Device Parameters Window will be displayed.
 - 2. Click the I/O Module Tab.
 - 3. Click the **Edit** Button on the *I/O Module* Tab Page. The Edit Unit Parameters Window will be displayed.
 - 4. Select the tab page for the input where scaling is to be performed, and select the *Scaling* Check Box in the *Function Choice* Area.

Peak/Bottom Hold

Peak/bottom hold is used to hold the maximum (peak) value or minimum (bottom) value of the analog input value. When the Hold Flag (output) allocated in the Output Area turns ON, the hold function starts, searching for the peak or bottom value until the Hold Flag turns OFF. (The peak/bottom value is refreshed when the Hold Flag turns OFF.) The comparator function can be used to compare the peak or bottom values allocated as analog data. (Refer to details on the comparator function.)

Example of Bottom Hold

Note A delay in network transmission time will occur from the time the Hold Flag turns ON (or OFF) in the Master's ladder program until notification of the flag's status is actually sent to the Unit. Therefore, even when the Hold Flag is ON, the first analog data transmitted to the Master when the CPU Unit power is turned ON may be the data from when the Hold Flag was OFF. To collect peak/bottom hold data using the Hold Flag at the Master, configure a ladder program that considers the transmission delay when the Hold Flag is turned ON, then enables the peak/bottom hold values after a fixed time interval.

Setting Procedure (Example: DeviceNet Configurator)

- In the Network Configuration Window for the Slice I/O Terminal, doubleclick the icon of the Slice I/O Terminal that is to be set. Alternatively, rightclick the icon and select *Parameters - Edit*. The Edit Device Parameters Window will be displayed.
 - 2. Click the I/O Module Tab.
 - 3. Click the **Edit** Button on the *I/O Module* Tab Page. The Edit Unit Parameters Window will be displayed.
 - 4. Select the tab page for the input where peak/bottom hold is to be set, and select the *Peak/Bottom Hold* Check Box in the *Function Choice* Area.

Top/valley hold is used to hold the top and valley values of the analog input value.

> Analog values that fluctuate more than twice the hysteresis value are monitored, and the top or valley values are held. The top or valley value is allocated along with the Top/Valley Detection Timing Flags, which can be used to check the hold timing.

> When the Hold Flag (output) allocated in the Output Area turns ON, the hold function starts, refreshing the top or valley value until the Hold Flag turns OFF. (The last value is held when the Hold Flag turns OFF, but the next time the Hold Flag turns ON, the hold value is initialized as soon as a top or valley occurs.) The comparator can be used to compare the top or valley value allocated as analog data. (Refer to details on the comparator function.)

Top/Valley Hold

Example of Valley Hold

- **Note** 1. A delay in network transmission time will occur from the time the Hold Flag turns ON (or OFF) in the Master's ladder program until notification of the flag's status is actually sent to the Unit. Therefore, even when the Hold Flag is ON, the first analog data transmitted to the Master when the CPU Unit power is turned ON may be the data from when the Hold Flag was OFF. To collect top/valley hold data using the Hold Flag at the Master, configure a ladder program which considers the transmission delay time when the Hold Flag is turned ON, then enables the top/valley hold values after a fixed time interval.
 - 2. The time that the Top/Valley Detection Timing Flags are ON can be adjusted by setting the one-shot time. Use the Setting Tool to set the one-shot time (the setting range is 1 to 65535 ms).
 - 3. If the Hold Flag turns OFF during the time the Top/Valley Detection Timing Flag is set to be ON, both flags will turn OFF simultaneously.

Setting Procedure (Example: DeviceNet Configurator)

- In the Network Configuration Window for the Slice I/O Terminal, doubleclick the icon of the Slice I/O Terminal that is to be set. Alternatively, rightclick the icon and select *Parameters - Edit*. The Edit Device Parameters Window will be displayed.
 - 2. Click the I/O Module Tab.
 - 3. Click the **Edit** Button on the *I/O Module* Tab Page. The Edit Unit Parameters Window will be displayed.

4. Select the tab page for the input where top/valley hold is to be set, and select the *Top/Valley Hold* Check Box in the *Function Choice* Area.

Hysteresis Setting

The hysteresis value can be set using the Setting Tool to prevent detection of top or valley values that occur due to minor fluctuations in the analog input value. This will cause the start of data holding to be delayed after the actual top or valley value occurs, as shown in the following diagram.

Timing for Setting Data

Setting Hysteresis (Example: DeviceNet Configurator)

1,2,3... 1. Input the value for hysteresis in the *Hysteresis* Field in the **Top/Valley** Tab in the *Function Choice* Area.

- 2. Return to the *General* Tab Page, click the **Download** Button, and then click the **Reset** Button to reset the Unit.
- 3. Click the **OK** Button to exit.

Rate of Change Calculation

The rate of change can be obtained for each sampling cycle set for the analog input data. This function calculates the difference between each set sampling cycle and value obtained in the previous cycle. The default setting for the sampling cycle is 100 ms and the sampling cycle setting range depends on the model, as shown in the following table.

Model	Sampling cycle setting range
GRT1-AD2	10 to 65,530 ms (Set in 10-ms units.)

Note If the sampling cycle is set to a small value, the rate of change will be sensitive to small changes. If the analog data is subject to minute fluctuations, and the sampling cycle is shorter than the cycle of fluctuation, the fluctuation will be

regarded as the rate of change. To prevent this occurring, use moving average processing, which will set a longer sampling cycle.

Setting Procedure (Example: DeviceNet Configurator)

- In the Network Configuration Window for the Slice I/O Terminal, doubleclick the icon of the Slice I/O Terminal that is to be set. Alternatively, rightclick the icon and select *Parameters - Edit*. The Edit Device Parameters Window will be displayed.
 - 2. Click the I/O Module Tab.
 - 3. Click the **Edit** Button on the *I/O Module* Tab Page. The Edit Unit Parameters Window will be displayed.
 - 4. Select the tab page for the input where rate of change is to be set, and select the *Rate of Change* Check Box in the *Function Choice* Area.

Comparator

When the High High Limit, High Limit, Low Low Limit, and Low Limit are set in the Unit, a flag will turn ON when a value exceeds the setting range. The four set values are High High Limit (HH), High Limit (H), Low Low Limit (LL), and Low Limit (L), and the values can be compared with those in Analog Data. When any of these values is exceeded, the Comparator Result Flag in the area for Analog Status Flags turns ON. If an alarm does not occur, the Normal Flag (pass signal) turns ON.

Note When the analog input value changes faster than the conversion cycle, the High Limit alarm may turn ON without the Normal Flag (pass signal) turning ON for the Low Limit alarm. Configure ladder programs to prevent this occurring.

Setting Hysteresis

The Comparator Result Flag turns OFF when the value is lower than the hysteresis width (H or HH alarm occurs) or exceeds it (L or LL alarm occurs), as shown in the following diagram. If the analog value fluctuates around the threshold, and the flag repeatedly turns ON or OFF, setting hysteresis will stabilize the flag operation.

Section 5-4

OFF Delay

The time until the Comparator Result Flag turns OFF can be extended. For example, even if the Flag is ON momentarily, the OFF delay can be set so that the Master can receive notification of the Flag's status.

Setting Procedure (Example: DeviceNet Configurator)

- In the Network Configuration Window for the Slice I/O Terminal, doubleclick the icon of the Slice I/O Terminal that is to be set. Alternatively, rightclick the icon and select *Parameters - Edit*. The Edit Device Parameters Window will be displayed.
 - 2. Click the I/O Module Tab.
 - 3. Click the **Edit** Button on the *I/O Module* Tab Page. The Edit Unit Parameters Window will be displayed.
4. Select the tab page for the input where the comparator function is to be set, and select the *Comparator* Check Box in the *Function Choice* Area.

Off-wire Detection

When a disconnection occurs in an analog input line (voltage input or current input), the Off-wire Detection Flag turns ON for each input that is enabled in the number of AD conversion points. The Off-wire Detection Flags are included in the Analog Status Flags.

When Off-wire Detection is enabled, the value of AD conversion data is set to 7FFF hex. When the input returns to a value within the range that can be converted, the Off-wire Detection function will automatically be turned OFF, and normal data conversion will occur.

Off-wire Detection functions with input ranges of 1 to 5 V or 4 to 20 mA only. With the 1 to 5 V input range, an off-wire condition is detected when the input voltage is below 0.76 V (less than 6%). With the 4 to 20 mA input range, an off-wire condition is detected when the input current is below 3.04 mA.

User Adjustment Depending on factors such as the characteristics and connection methods of the input device, the input can be adjusted to compensate for error in the input voltage or current. The following diagram shows when compensation is applied to the conversion line at the two points for 0% and 100%.

The following table shows the input ranges that support user adjustment.

Input range	Low Limit	High Limit
0 to 5 V	-0.25 to 0.25 V	4.75 to 5.25 V
1 to 5 V	0.8 to 1.2 V	4.8 to 5.2 V
0 to 10 V	–0.5 to 0.5 V	9.5 to 10.5 V
-10 to 10 V	–11 to –9.0 V	9.0 to 11 V
4 to 20 mA	3.2 to 4.8 mA	19.2 to 20.8 mA
0 to 20 mA	-1.0 to 1.0 mA	19 to 21 mA

Setting Procedure (Example: DeviceNet Configurator)

- In the Network Configuration Window for the Slice I/O Terminal, doubleclick the icon of the Slice I/O Terminal that is to be set. Alternatively, rightclick the icon and select *Parameters - Edit*. The Edit Device Parameters Window will be displayed.
 - 2. Click the I/O Module Tab.
 - 3. Click the **Edit** Button on the *I/O Module* Tab Page. The Edit Unit Parameters Window will be displayed.

4. Select the tab page for the input to be adjusted, and click the **Adjustment** Button. (At the same time set the input range again.)

- 11. Click the **OK** Button to exit.

Cumulative Counter

The cumulative counter calculates an approximation to the integral of analog input values over time. The cumulated value can be calculated in "count hours" (by selecting "hours") or "count minutes" (by selecting "minutes"). The count value is the analog input value in the industry unit obtained after scaling. For example, 100.0 count hours indicates a value equivalent to an analog input value of 100 counts continuing for one hour. The counter range for a four-byte area (two words) for count hours or count minutes is –214,748,364.8 to 214,748,364.7. Data is displayed on the Setting Tool in units of 0.1 hour or minute.

Monitor values can also be set in the Unit. When the cumulated count value exceeds the set monitor value, the Cumulative Counter Flag in the area for Generic Status Flags turns ON.

Note The following table shows the divisions for the cumulative counter.

DRT2-AD2

Unit	Divisions
Hour	3.6 s (1/1,000 hour)
Minute	60 ms (1/1,000 minute)

Setting Procedure (Example: DeviceNet Configurator)

- In the Network Configuration Window for the Slice I/O Terminal, doubleclick the icon of the Slice I/O Terminal that is to be set. Alternatively, rightclick the icon and select *Parameters - Edit*. The Edit Device Parameters Window will be displayed.

5-4-4 Calculating the Conversion Cycle

The conversion cycle speed can be improved by setting the number of AD conversion points, but will vary with the use of the math operations. Use the following table and formula to calculate the conversion cycle time.

Formula

AD conversion cycle time = AD base conversion time + Σ (Additional time for each function)

AD base conversion time: Cycle time when the math operation is not used at all. The value for each conversion point from 1 to 2 is different.

Extra time for each function: The additional time that is required when math operations are used.

The following table shows the AD base conversion times (unit: ms).

Time	1 point	2 points
Max.	1.66	2.42
Min.	0.68	0.81
Average	0.88	1.60

Note The DeviceNet communications cycle is 4 ms.

The following table shows the additional time required for each function (unit: ms).

Math operation	Additional time for each point
Moving average	0.045
Scaling	0.055
Peak/bottom hold	0.025
Top/valley hold	0.070
Comparator	0.065
Rate of change	0.030
Cumulative counter	0.035

Calculation Example

When using two points, and applying scaling to the first input, and the cumulative counter to the second input, the maximum AD conversion cycle time can be obtained by using the following formula.

Formula: 2.42 + 0.055 + 0.035 = 2.51 ms

5-5 Analog Output Units

5-5-1 GRT1-DA2C/GRT1-DA2V Analog Output Units

General Specifications

Item	Specifications
Unit power supply voltage	24 V DC (24 V DC –15% to +10%)

Item	Specifications
	GRT1-DA2V Voltage output GRT1-DA2C Current output
DA conversion data	-10 to 10 V range: F448 to 0BB8 hex full scale (-3,000 to 3,000)
	Other ranges: 0000 to 1770 hex full scale (0 to 6,000)
	DA conversion range: $\pm 5\%$ FS of the above data ranges.
Isolation method	Photocoupler isolation (between output and communications lines
	No isolation between output signal wires.
I/O connection method	Terminal-block connection

Note In 0- to 20-mA mode, accuracy cannot be ensured at 0.2 mA or less.

Names and Functions of Parts

Setting the Output Signal Range

Setting with the DIP Switch

The output range can be set using the DIP switch or the Setting Tool.

■ GRT1-DA2V

Each pin is set according to the following table.

Pin No.	Setting	Specifications
1	Set the output range for Outputs 0	Default setting: All pins OFF
2	and 1.	
3	Reserved	Fixed at OFF.
4	Set the range setting method.	OFF: Set using Setting Tool.
		ON: Set using DIP switch.
		Default setting: OFF

Output range	Pin 1	Pin 2	Pin 3
0 to 5 V (Factory set- ting)	OFF	OFF	Fixed at OFF.
1 to 5 V	ON	OFF	
0 to 10 V	OFF	ON	
-10 to 10 V	ON	ON	

Note 1. Always set pin 4 to ON if the DIP switch is used to set the range. If this pin is OFF, the DIP switch settings will not be enabled.

2. The DIP switch settings are read when the power is turned ON.

■ GRT1-DA2C

Each pin is set according to the following table.

Pin No.	Setting	Specifications
1	Set output range for Outputs 0 and 1.	Default setting: All pins OFF
2	Reserved	Fixed at OFF.
3		
4	Range setting method	OFF: Set using Setting Tool.
		ON: Set using DIP switch.
		Default setting: OFF

Output range	Pin 1	Pin 2	Pin 3
4 to 20 mA	OFF	Fixed at OFF.	
0 to 20 mA	ON		

Setting Using the DeviceNet Configurator

Use the following procedure to set the output range for each output using the Configurator.

- In the Network Configuration Window for the Slice I/O Terminal, doubleclick the icon of the Slice I/O Terminal that is to be set. Alternatively, rightclick the icon and select *Parameters - Edit*. The Edit Device Parameters Window will be displayed.
 - 2. Click the I/O Module Tab.
 - 3. Click the **Edit** Button on the *I/O Module* Tab Page. The Edit Unit Parameters Window will be displayed.
 - 4. Select the tab page for the output where the range is to be changed.

5. Click the Output Range Field, and select the desired range.

Internal Circuits

Output Range and Conversion Data

The digital values that are output are converted to analog data according to the output range used, as shown below. When the value exceeds the output range, the DA conversion data is fixed at the High Limit or Low Limit set value.

Section 5-5

Output Range: 0 to 5 V

The values 0000 to 1770 hex (0 to 6,000) correspond to the voltage range 0 to 5 V. The output range is -0.25 to 5.25 V.

The values 0000 to 1770 hex (0 to 6,000) correspond to the voltage range 1 to 5 V. The output range is 0.8 to 5.2 V.

The values 0000 to 1770 hex (0 to 6,000) correspond to the voltage range 0 to 10 V. The output range is -0.5 to 10.5 V.

Output Range: -10 to 10 V

The values F448 to 0BB8 hex (-3,000 to 3,000) correspond to the voltage range -10 to 10 V. The output range is -11 to 11 V. Negative voltages are specified as two's complements (16 bits).

The values 0000 to 1770 hex (0 to 6,000) correspond to the current range 4 to 20 mA. The output range is 3.2 to 20.8 mA.

Output Range: 0 to 20 mA

The values 0000 to 1770 hex (0 to 6,000) correspond to the current range 0 to 20 mA. The output range is 0 to 21 mA.

DA Conversion Data

DA conversion data is output to the Communications Unit as shown in the following diagram.

When outputting negative voltages, specify the DA conversion data as two's complements. The NEG instruction can be used to obtain two's complements from absolute values.

Note Although the number of DA conversion points is set from the Setting Tool, the allocated data does not change (i.e., two words are used).

5-5-2 I/O Data and Allocation Methods

When the Analog Output Unit's default settings are used, output data is allocated. No special settings are required. Two words (four bytes) of output data are allocated as two's complement.

5-5-3 Functions and Setting Methods

Scaling

The default setting is used to perform DA conversion, converting analog output values that have been scaled to a count of 0 to 6,000 into corresponding digital values in the output signal range. Scaling can be used to change scaled values that correspond to the output signal range into other values required by the user (industry unit values). Scaling also eliminates the need for ladder programming in the Master to perform math operations. The following two methods of scaling can be used.

Default ScalingDefault scaling converts analog output values into voltage or current values.
The units used are mV or μA . When default scaling is selected, scaling is per-
formed according to the output range, as shown in the following table.

		-				
Output range	0 to 5 V	0 to 10 V	1 to 5 V	–10 to 10 V	0 to 20 mA	4 to 20 mA
100%	5,000 mV	10,000 mV	5,000 mV	10,000 mV	20,000 μA	20,000 µA
0%	0000 mV	0000 mV	1,000 mV	–10,000 mV	0000 μΑ	4,000 μΑ
Off-wire			7FFF hex			7FFF hex

Analog Output Units

User Scaling

User scaling allows analog output values to be scaled to user-defined values. The conversion values for 100% and 0% are set using the Setting Tool.

Section 5-5

Input range	0 to 5 V	0 to 10 V	1 to 5 V	–10 to 10 V	0 to 20 mA	4 to 20 mA
100%	Set using S	Set using Setting Tool (-28,000 to 28,000)				
0%	Set using Setting Tool (-28,000 to 28,000)					
Off-wire			7FFF hex			7FFF hex

Note Reverse scaling, where the 0% scaling value is higher than the 100% scaling value, is also supported.

Offset Compensation Offset compensation is used to compensate for error that occurs during scaling. The offset amount is added to the scaled line before processing, as shown in the following diagram. The offset (error) value can be input between -28,000 and 28,000, but if underflow or overflow occurs in the scaled line, the 100% or 0% output will not be possible. The High Limit is 7FFE hex and the Low Limit is 8000 hex.

Note The offset value can be set even when using default scaling.

Setting Procedure (Example: DeviceNet Configurator)

- In the Network Configuration Window for the Slice I/O Terminal, doubleclick the icon of the Slice I/O Terminal that is to be set. Alternatively, rightclick the icon and select *Parameters - Edit*. The Edit Device Parameters Window will be displayed.
 - 2. Click the I/O Module Tab.
 - 3. Click the **Edit** Button on the *I/O Module* Tab Page. The Edit Unit Parameters Window will be displayed.
 - 4. Select the tab page for the output where scaling is to be performed, and select the *Scaling* Check Box in the *Function* Choice Area.

- 9. Click the **OK** Button to exit.

User Adjustment

Depending on factors such as the characteristics and connection methods of the output device, the output can be adjusted to compensate for error in the final output. The following diagram shows when compensation is applied to the conversion line at the two points for 0% and 100%.

The ranges supported for adjustment (-5% to +5%) are shown in the following table. If adjustment cannot be performed within the following ranges, check the method being used to connect the output device.

Output range	Low Limit	High Limit
0 to 5 V	–0.25 to 0.25 V	4.75 to 5.25 V
1 to 5 V	0.8 to 1.2 V	4.8 to 5.2 V
0 to 10 V	–0.5 to 0.5 V	9.5 to 10.5 V

Output range	Low Limit	High Limit
-10 to 10 V	–11 to –9.0 V	9.0 to 11 V
4 to 20 mA	3.2 to 4.8 mA	19.2 to 20.8 mA
0 to 20 mA	0.2 to 1.0 mA	19 to 21 mA

Setting Procedure (Example: DeviceNet Configurator)

- In the Network Configuration Window for the Slice I/O Terminal, doubleclick the icon of the Slice I/O Terminal that is to be set. Alternatively, rightclick the icon and select *Parameters - Edit*. The Edit Device Parameters Window will be displayed.
 - 2. Click the I/O Module Tab.
 - 3. Click the **Edit** Button on the *I/O Module* Tab Page. The Edit Unit Parameters Window will be displayed.
 - 4. Select the tab page for the output to be adjusted, and click the **Adjustment** Button. (At the same time, set the output range again.)

Default <u>S</u> etting	Close

Adjusting the High Limit

Note If the High Limit adjustment is not performed for the 100% value, a discrepancy will occur when the Low Limit is adjusted, so always adjust the Low Limit of Output Units before adjusting the High Limit.

Cumulative Counter

The cumulative counter calculates an approximation to the integral of analog output values over time. The cumulated value can be calculated in "count hours" (by selecting "hours") or "count minutes" (by selecting "minutes"). The count value is the analog output value in the industry unit obtained after scaling. For example, 100.0 count hours indicates a value equivalent to an analog output value of 100 counts continuing for one hour. The counter range for a four-byte area (two words) for count hours or count minutes is -214,748,364.8 to 214,748,364.7. Data is displayed on the Configurator in units of 0.1 hours or minutes.

Monitor values can also be set in the Unit. When the cumulated count value exceeds the set monitor value, the Cumulative Counter Flag in the area for Generic Status Flags turns ON.

Note The following table shows the divisions for the cumulative counter.

Unit	Divisions
Hour	3.6 s (1/1,000 hour)
Minute	60 ms (1/1,000 minute)

Setting Procedure (Example: DeviceNet Configurator)

- In the Network Configuration Window for the Slice I/O Terminal, doubleclick the icon of the Slice I/O Terminal that is to be set. Alternatively, rightclick the icon and select *Parameters - Edit*. The Edit Device Parameters Window will be displayed.
 - 2. Click the **I/O Module** Tab.
 - 3. Click the **Edit** Button on the *I/O Module* Tab Page. The Edit Unit Parameters Window will be displayed.

4. Select the tab page for the output where the cumulated counter is to be set, and select the *Cumulated Count* Check Box in the *Function Choice* Area.

Setting Output Value for Errors

The Output Unit value that is output when communications errors (timeout and BusOff errors) or slice bus errors occur can be set in word units. The four output value settings are set using the Setting Tool.

Setting Patterns

Low limit	Outputs the values in the following table according to the output range.
High limit	Outputs the values in the following table according to the output range.
Hold last state	Holds and outputs the value from immediately before the error occurred.
	Outputs the value when 0 is written from the Host. This setting will be affected by scaling settings that are used.

Output Ranges and Values

Output range	Low limit	High limit	Hold last state
0 to 5 V	–0.25 V	5.25 V	Holds value.
1 to 5 V	0.8 V	5.2 V	Holds value.
0 to 10 V	–0.5 V	10.5 V	Holds value.
–10 to 10 V	–11 V	11 V	Holds value.
4 to 20 mA	3.2 mA	20.8 mA	Holds value.
0 to 20 mA	0 mA	21 mA	Holds value.

Note When a node address has been used more than once or a Unit error has occurred, the current output will be 0 mA and the voltage output will be 0 V, regardless of the setting.

Setting Procedure (Example: DeviceNet Configurator)

- In the Network Configuration Window for the Slice I/O Terminal, doubleclick the icon of the Slice I/O Terminal that is to be set. Alternatively, rightclick the icon and select *Parameters - Edit*. The Edit Device Parameters Window will be displayed.
 - 2. Click the I/O Module Tab.
 - 3. Click the **Edit** Button on the *I/O Module* Tab Page. The Edit Unit Parameters Window will be displayed.
 - 4. Select the tab page for the output where the error output value is to be set, and select the desired item from the pull-down menu in the *Fault State* (output during a slice bus error) Field or *Idle State* (output during a communications error) Field.

6-1 Overview of the Temperature Input Unit

This section provides an overview of the Temperature Input Unit, including details on functions and setting methods.

6-1-1 Temperature Input Unit

In addition to the functions common to the GRT1 Series (backup, restore, online conversion, etc.), other functions specific to the Temperature Input Unit (scaling, peak/bottom hold, etc.) are available. The Temperature Input Unit is also able to internally perform math on temperature input values, which previously required ladder programming in the host PLC. Temperature data can be selected from the six values obtained from math operations and allocated as I/O in combination with Status Flags or other status information. The Setting Tool can be used to allocate this status data, to make settings for monitoring and specific Temperature Input Unit functions, and to monitor operation.

6-1-4 List of Data Processing Functions

GRT1-TS2 Temperature Input Unit

Function		Details	Default
Moving average		Calculates the average of the past eight temperature input values, and produces a stable input value even when the input value is unsteady.	Moving average disabled.
Scaling		Performs scaling. The unit can be converted to default upper and lower limits to reduce the number of operations requiring ladder pro- gramming in the Master CPU Unit. Scaling also supports an offset function for compensating for mounting errors in sen- sors and other devices.	Disabled (0 to 28,000)
Peak/bottom hold		Holds the maximum and minimum temperature input values.	Disabled
Top/valley hold		Holds the top and valley values for temperature input values.	Disabled
Rate of change		Calculates the rate of change for temperature input values.	Disabled
Comparator		Compares the temperature input value or an data after math processing (i.e., value for peak, bottom, top, valley, rate of change) with the four set values HH, H, L, and LL, and indicates the result with the Temperature Status Flags.	Disabled
Off-wire d	letection	Detects disconnections of sensors.	Enabled
Input error detection disable		Detection of input errors, including off-wire detection, can be disabled. This setting would be used for inputs that are not used.	Disabled
User adjustment		An offset caused by hardware inaccuracy (or other factor) can be corrected with an arbitrary user-set input value.	Disabled
Last maintenance date		Records the date of the last maintenance in the Unit.	2007/1/1
Data comparison between channels		Calculates the difference in temperature between the two input channels to enable a relative comparison.	Disabled
Replace- ment monitor- ing functions	Cumulated count	Calculates the total heat exposure of a device or sensor by integrating the temperature over the measurement time.	Disabled
	Top/valley count	Counts the number of heating cycles handled by a device or application that has fixed cycles of temperature change.	Disabled
	Temperature range total time	Measures how long the system is at a user-set temperature or within a user-set temperature range.	Disabled

6-1-5 Data Processing Flowcharts

Temperature Input ValueThe following math operations can be performed on the external temperature
input value. The values obtained after processing (temperature input values)
can be allocated for the Master.
• Scaling as required by the user
• Moving average processingOther Operation ResultsAfter moving average and scaling processing, the temperature input value can
be processed using the following operations. The values after processing are
called peak value, bottom value, top value, valley value, rate of change, and

- Peak/bottom operation
- Top/valley operation

cumulated value.

- Rate of change operation
- Cumulative operation (maintenance function)

Analog processing is performed according to the following flowchart.

6-1-6 Selecting Data

After performing math operations, select one of the six resulting values to allocate as outputs to the Master, from the temperature input value, peak value, bottom value, top value, valley value, and rate of change. The selected data is referred to as "temperature data" and can be allocated for the Master individually or in combination with status flags. The data is selected using the Setting Tool. Comparison operations with four alarm set values can be performed for temperature data using the Comparator.

Flow of Data in Temperature Input Unit

Note By default, the temperature input values are allocated to the Master without any processing.

For inputs 0 and 1, temperature data can be separately selected, as shown in the following diagram.

6-1-7 I/O Data

Temperature Input Unit The Temperature Input Unit supports the following six types of input data, and one type of output data. The required data can be allocated for use as I/O. The default input value "Temperature Data Normal Display." No data is output by default.

Input Data

Input data	Details	
Temperature Data Normal Display (4 input bytes)	 Used to monitor temperature data. Select one type of data from temperature input value, peak value, bottom value, top value, valley value, or rate of change. (Default allocation: Temperature input value) Note The comparator can be used with temperature data. 	
Temperature Data 1/100 Dis- play (8 input bytes)		
Top/Valley Detection Timing Flags (2 input bytes)	Top/Valley Detection Timing Flags are allocated in one word. These flags are allocated together with the top value or valley value and are used to time reading the values held in the Master.	

Input data	Details
Temperature Status Flags (2 input bytes)	Used to allocate the bits for the Comparator Result Flags, Top/Valley Detection Timing Flags, and Off-wire Detection Flags. The function of each bit is as follows:
	 Comparator Result Flags Allow control of the judgement results only, without allocating temperature values Top/Valley Detection Timing Flags Used to time reading the values held as the top and valley values when both the top and value values are allocated at the same time.
	 Off-wire Detection Flags Disconnections can be detected even when the temperature values are not allocated.
Temperature Data Normal Display + Top/Valley Detection Timing Flags (6 input bytes)	Allocation of the Temperature Data followed by the Top/Valley Detection Timing Flags.
Temperature Data 1/100 Dis- play + Top/Valley Detection Timing Flags (10 input bytes)	

Output Data

Output data	Details
Hold Flags (1 output byte)	Used with each of the hold functions (peak, bottom, top, and valley) to control the execu- tion timing of hold functions from the Master.

6-2 Status Areas

A Temperature Input Unit has two internal Status Areas. Bits are set with respect to thresholds set by the user for each function. When any bit turns ON in one of these Status Areas, the relevant Communications Unit Status Flag turns ON. The Master Unit is notified of the status of Communications Unit Status Flags. Information in I/O Unit Status Areas can be read using the Setting Tool.

If the Temperature Input Unit Status Flag turns ON, the relevant Communications Unit Status Flag will turn ON.

<u>GRT1-TS2</u>

Warning Status Area

The Temperature Input Unit's Warning Status Area is configured of the following 16 bits. The Warning Status Area provides notification of minor errors in the Unit.

Bit	Contents	Description
0	Reserved.	
1	Reserved.	
2	Reserved.	
3	Unit Maintenance Flag OFF: Normal; ON: Error (over threshold)	Monitors the power-ON time set as the threshold for the Unit conduction time monitoring function.

6-3 Maintenance Information Window

This section describes the Maintenance Information Window, which can be used to monitor the status of a Temperature Input Unit.

6-3-1 Checking Maintenance Information

There are two ways to check maintenance information. One way is to right-click in the Main Window of the Setting Tool and select *Maintenance Information*. The other way is to double-click the Unit in the Maintenance Mode Window, click the *I/O* **Module** Tab, select the desired Unit, and click the **View** Button to display the Maintenance Information Window of the *I/O* Unit.

Display Area

ltem	Description
Comment	Displays up to 32 characters of text set as the Unit comment.
Last Maintenance Date	Displays the last maintenance date that was set.
Unit Conduction Time	Displays the total time that the Unit has been ON (cumulated power ON time).
Update Button	Click this button to update the maintenance information.
Save Maintenance Counter Button	This button saves the maintenance counter values in the Unit. If this button is used, the saved values will be retained when the power supply is turned OFF and ON again.

Status Check Boxes

ltem	Description
Unit Maintenance	Turns ON when the total Unit ON time exceeds the set value.
Cumulated Value	Turns ON when the cumulative counter value exceeds the set value for any one input.
EEPROM Data Error	Turns ON when the data contained in EEPROM is invalid.
Cold junction com- pensator error (GRT1-TS2T only)	Turns ON when there is an error in the cold junction compen- sator.

Display Area

ltem	Description	
Input Type	Shows the present input type.	
Display Mode	Indicates the number of digits displayed.	
	0000: No decimal point. (GRT1-TS2T only)	
	0000.0: Displays to the 10ths place (0.1).	
	0000.00: Displays to the 100ths place (0.01).	
I/O Comment	Displays up to 32 characters of text as a comment. A separate comment can be set for each input.	

Item	Description
Last Maintenance Date	Displays the last maintenance date and time.
Present Value	Displays the present temperature input value.
	Displays data derived from the temperature input value, including the Peak Value, Bottom Value, Top Value, Valley Value, Rate of Change, Temperature Range Total Time, Top/Valley Count, Cumulated Count, Maximum Value, and Minimum Value.
	For details, refer to the descriptions of individual functions and setting methods.

Status Check Boxes

ltem	Description
Threshold Cumu- lated Counter Over	ON when the cumulative counter value exceeds the set value.
Cumulated Counter Overflow	ON when there is an overflow in the cumulative counter value.
Cumulated Counter Underflow	ON when there is an underflow in the cumulative counter value.
Over Range/Under Range	ON when the temperature data is above or below the display- able range.
Alarm Over/Warning Over	ON when the analog data is above or below the monitoring set values set in the comparator function.
Broken wire	ON when a wire is broken or disconnected.
Temperature Range Total Time Over	ON when the present value being counted in the set range exceeds the monitoring set value.
Top/Valley Count Over	ON when the top or valley count exceeds the monitoring set value.
User Adjustment	ON when the user-set adjustment function is operating.

Data Comparison between Channels Tab Page

Each comparison number (No.) corresponds to the comparison of a pair of inputs.

Gen	eral Temperature Input 0 Ti)ata comparison between channels	emperature Input 1 Error History
No.	Comarison Description	Result Value
00	Difference of temperature (Input1 - Input0)	0.20
01	Difference of temperature (Input0 - Input1)	-0.20

Item	Description
Comparison Description	Displays the inputs used in the error calculation.
Result Value	Displays the calculation results.

Note

(1) When a result value exceeds the monitoring set value, a red alarm icon will be displayed to the left of the comparison number.

- (2) When either of the comparison inputs is disconnected (off-wire detected), the result value will be set to 0.00 and a yellow alarm icon will be displayed to the left of the comparison number.
- **Error History Tab** For details on the Error History Tab Page, refer to 4-5-1 Checking Maintennance Information.

6-4 Temperature Input Unit

6-4-1 GRT1-TS2 Temperature Input Unit

General Specifications

ltem	Specifications
Model	GRT1-TS2P/-TS2PK/-TS2T
Unit power supply voltage	24 V DC (24 V DC -15% to +10%)
I/O power supply voltage	I/O power supply not required.
Noise immunity	Conforms to IEC 61000-4-4. 2.0 kV (power lines)
Vibration resistance	10 to 60 Hz, 0.7-mm double amplitude, 60 to 150 Hz, 50 m/s 2
Shock resistance	150 m/s ²
Dielectric strength	500 V AC for 1 min. with 1-mA sensing current (between isolated circuits)
Ambient temperature	-10 to 55°C (with no icing or condensation)
Ambient humidity	25% to 85%
Operating environment	No corrosive gases
Storage temperature	-25 to 65°C (with no icing or condensation)
Mounting	35-mm DIN Track mounting

Performance Specifications

GRT1-TS2P/TS2PK

Item	Specifications		
Model	GRT1-TS2P	GRT1-TS2PK	
Input	Platinum resistance therm	ometer	
Number of I/O points	2 inputs (Two input words are allocated in the Master when normal display mode is selected or 4 input words are allocated when 1/100 display mode is selected.)		
Input type	PT100 (-200 to 850°C) or PT100 (-200 to 200°C); switching possible. Using Setting Tool: Can be set separately for each input. Using DIP switch: Both inputs are set together.	PT1000 (-200 to 850°C) or PT1000 (-200 to 200°C); switching possi- ble. Using Setting Tool: Can be set separately for each input. Using DIP switch: Both inputs are set together.	
Indication accuracy	-200 to 850°C input range:		
	(±0.3% of indication value or ±0.8°C, whichever is larger) ±1 digit max.		
	-200 to 200°C input range:		
	(±0.3% of indication value or ±0.5°C, whichever is larger) ±1 digit max.		

Item	Specifications
Conversion cycle	250 ms/2 points
Temperature conversion data	Binary data two's complement (4-digit hexadecimal when normal display mode is selected or 8-digit hexadecimal when 1/100 display mode is selected)
Isolation method	Between input and communication lines: Photocoupler isolation
	Between temperature input signals: Photocoupler iso- lation

Note For the GRT1-TS2P, a current of 0.35 mA flows to the platinum resistance thermometer. For the GRT1-TS2PK, a current of 0.035 mA flows to the platinum resistance thermometer.

Note A 2-wire connection has a strong affect on the conductor resistance. When using a 2-wire connection, the conductor resistance *r* directly determines the error.

GRT1-TS2P: The error will be 4°C/ Ω for each line. For example, when using a conductor with a resistance *r* of 1 Ω , the total conductor resistance would be 1 $\Omega \times 2 = 2 \Omega$. Therefore, an error of 4°C/ $\Omega \times 2 \Omega = 8.0^{\circ}$ C would occur.

GRT1-TS2PK: The error will be $0.4^{\circ}C/\Omega$ for each line. For example, when using a conductor with a resistance *r* of 1 Ω , the total conductor resistance would be 1 $\Omega \times 2 = 2 \Omega$. Therefore, an error of $0.4^{\circ}C/\Omega \times 2 \Omega = 0.8^{\circ}C$ would occur.

ltem	Speci	fications	
Model	GRT1-TS2T		
Input type	Thermocouple		
Number of inputs	2 inputs (Two input words are allocated in the Master when normal display is selected or 4 input words are allocated when 1/100 display mode is selected.)		
Input type	R, S, K, J, T, E, B, N, L, U, W, or	PL2	
Indication accu-	±2°C ±1 digit max. (See note.)		
racy	The following are exceptions.		
	Input type	Input accuracy	
	–100°C max. for K, T, or N	±4°C ±1 digit max.	
	U or L	±4°C ±1 digit max.	
	200°C max. for R and S	±6°C ±1 digit max.	
	400°C max. for B Not specified		
	W	$(\pm 0.3\% \text{ or } \pm 6^{\circ}\text{C}, \text{ whichever is}$ larger) ± 1 digit max.	
	PL2	$(\pm 0.3\% \text{ or } \pm 4^{\circ}\text{C}, \text{ whichever is}$ larger) ± 1 digit max.	

ltem	Specifications
Conversion cycle	250 ms/2 points
Temperature conversion data	Binary data two's complement (Four-digit hexadecimal when nor- mal display mode is selected or 8-digit hexadecimal when 1/100 display mode is selected.)
Isolation method	Between input and communication lines: Photocoupler isolation
	Between temperature input signals: Photocoupler isolation

Note There are exceptions to the input accuracy specifications depending on the mounting direction. Refer to the following information.

■ Exceptions to Specifications Depending on Mounting Direction

Mounting direction	Input accuracy		
Standard mounting (1)	Indication accuracy given in the table above		
Any mounting other than	an then		
mounting 1 in the following fig-	The following are exceptions Input type	Input accuracy	
ures	–100°C max. for K, T, or I	↓ ±8°C ±1 digit max.	
	U or L	±8°C ±1 digit max.	
	200°C max. for R or S	±12°C ±1 digit max.	
	400°C max. for B	Not specified	
	W	$(\pm 0.3\% \text{ or } \pm 12^{\circ}\text{C}, \text{ whichever}$ is larger) ± 1 digit max.	
	PL2	±0.3% or ±8°C, whichever is larger	

Names and Functions of Parts

LED Indicators

TS Indicator

ERR Indicators

The TS indicator shows the status of the Slice I/O Unit itself. Refer to 2-1-3 *LED Indicators* for details. (For the GRT1-TS2T only, the indicator will flash red if an error occurs in the cold junction compensator.)

The ERR indicators show input errors.

Name	Color	Status		Meaning	
ERR0	Red		Lit	Error	An input error has occurred in input 0.
			Not lit	Normal status	There is no input error for input 0.
ERR1	Red		Lit	Error	An input error has occurred in input 1.
			Not lit	Normal status	There is no input error for input 1.

An input error occurs when the input value exceeds the convertible temperature range. Disconnections and cold junction compensation errors are treated as input errors. Refer to *Convertible Temperature Ranges* on page 169 for more information. For information on LED indicator troubleshooting, refer to *9-2 LED Indicators and Error Processing* for details.

Setting the Input Type

The input type can be set using the DIP switch or the Setting Tool.

Setting with the DIP Switch

1	2	3	4

Each pin is set according to the following table.

Pin	Setting	Specifications
1 2	Select the input type (i.e., input range). Make the input type setting using the combinations in the fol- lowing table.	Default setting: OFF

Pin	Setting	Specifications
3	Select a °C or °F display.	OFF: °C conversion
		ON: °F conversion
		Both inputs are set together and cannot be set individually. The default setting is OFF. The selection of °C or °F display cannot be set with the Setting Tool.
4	Select the input type setting method. Select either setting with DIP switch or with the Setting Tool.	OFF: Set with the Setting Tool.
		ON: Set with DIP switch.
		When the input type is set with the DIP switch, all inputs must be set to the same input type. To set different input types, use the Setting Tool to make the settings.
		Default setting: OFF

Note If the settings are incorrect, the TS Indicator will flash red and the Unit will not operate. In this case, make the settings again and cycle the power supply.

■ GRT1-TS2P

SW1	SW2	Input type
OFF	OFF	PT100 (-200 to 850°C)
OFF	ON	PT100 (-200 to 200°C)

■ GRT1-TS2PK

SW1	SW2	Input type
OFF	OFF	PT1000 (-200 to 850°C)
OFF	ON	PT1000 (-200 to 200°C)

■ GRT1-TS2T

SW1	SW2	Input type
OFF	OFF	R
ON	OFF	S
OFF	ON	к
ON	ON	J

Note 1. Use the Setting Tool to make the setting if an input type other than those listed above will be used.

- 2. Always set Pin 4 to ON if the DIP switch is to be used to set the input type. If this pin is OFF, the DIP switch settings will not be enabled.
- 3. The DIP switch settings are read when the power is turned ON.

Setting Procedure (Example: DeviceNet Configurator)

- In the Network Configuration Window for the Slice I/O Terminal, double-click the icon of the Slice I/O Terminal that is to be set. Alternatively, right-click the icon and select *Parameters Edit*. The Edit Device Parameters Window will be displayed.
 - 2. Select the Temperature Input Unit to be edited from the *I/O Module* Tab Page.
 - 3. Click the **Edit** Button on the *I/O Module* Tab Page. The Edit Unit Parameters Window will be displayed.
 - 4. Select the tab page for the input where the input type is to be changed.

5. Double-click the *Value* Setting for the *Input Type* on the *Range/Data Allo-cation* Tab Page and select the desired input type from the pull-down menu.

	1,820.00	2C6F0	3,220.00	4E9D0
PL2	-20.00 to	FFFFF830 to	-20.00 to	FFFFF830 to
	1,320.00	203A0	2,320.00	38A40

Note

(1) The display data will be clamped at the minimum or maximum value of the display range between the time when the display range is exceeded, and an off-wire condition is detected.

- (2) When an off-wire condition is detected, the display data will be 7FFF in normal mode and 7FFF FFFF in 1/100 display mode.
- (3) If the Unit is subjected to sudden temperature changes, moisture may condense in the Unit and cause incorrect indications. If there is condensation, remove the Unit from service and keep it at a steady temperature for about 1 hour before using it again.
- (4) If the input temperature exceeds the convertible range, an input error will occur and the ERR indicator for that input will turn ON. If the input temperature is higher than the maximum value, an over range error will occur and the temperature data will be clamped at the maximum value. If the input temperature is lower than the minimum value, an under range error will occur and the temperature data will be clamped at the minimum value. If the input temperature is lower than the minimum value, an under range error will occur and the temperature data will be clamped at the minimum value. If the temperature exceeds the convertible range by a certain value, an off-wire condition (broken or disconnected input wire) will be detected and the temperature data will be set to 7FFF. If the input temperature returns to the convertible range, the off-wire detection function will be reset automatically, the corresponding ERR indicator will go out, and normal conversion data will be stored.

Internal Circuits GRT1-TS2P/TS2PK

NTLP: WAITING FOR GRAPHIC P6-23

Terminal Arrangement and Wiring

```
GRT1-TS2P/TS2PK
```

When using a 2-wire sensor, short-circuit the SHT terminals for that input.

Note If a 2-wire sensor is wired as shown below, the error in the accuracy will be much greater when compared to the wiring method in the above figure. Wire according to the above figure whenever possible.

GRT1-TS2/TS2PK

- **Note** If an input is not being used, an input error will occur and an over range error and off-wire condition will be detected. Proceed in one of the following ways.
 - Wire to unused terminals.
 - Set a parameter with the Setting Tool so that input errors will not be detected. (Refer to *Disabling Input Error Detection* on page 200.)

If unused inputs are left disconnected, the Temperature Input Warning Flag in the Warning Status Area and the Off-wire Detection Flag in the Alarm Status will turn ON. If the Temperature Status Flag is used, the Off-wire Detection Flag will turn ON. In addition, the ERR indicator will light. Here we will introduce the method for connecting to the unused terminals.

- GRT1-TS2P: 50 to 150 Ω
- GRT1-TS2PK: 500 to 1,500 Ω

6-4-2 Temperature Input Unit Display Modes

Normal Display Mode (Default Setting)

The input temperature data is converted to 4-digit hexadecimal digital data and transmitted to the Master. If the conversion data is negative, the negative value is expressed as the two's complement.

Two words are allocated in the Master, as shown in the following diagram. If the input type's data has one decimal place, the value transmitted to the Master is 10 times the actual value. (The decimal point is omitted.)

Example 1: 100.0°C: 03E8 hex Example 2: 350.0°C: 0DAC hex

NC

NC

1/100 Display Mode

The input temperature data for all input types is transmitted to the Master as data with precision to the 100ths (0.01) digits. The temperature data is multiplied by 100 and converted to 8-digit hexadecimal digital data (long binary values). If the conversion data is negative, the negative value is expressed as the two's complement. Four words are allocated in the Master for the two inputs, as shown in the following diagram.

	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0	Bit

First word + 3	Inp	out 1	l ten	nper	atur	e co	nver	sior	n dat	a (le	eftmo	ost b	ytes)			

Example 1: 850.00°C

00014C08 hex (Rightmost data = 4C08 hex, Leftmost data = 0001 hex) Example 2: -200.00°C

FFFFB1E0 hex (Rightmost data = B1E0 hex, Leftmost data = FFFF hex)

Setting the 1/100 Display Mode The 1/100 Display Mode is set from the network Setting Tool. Setting cannot be done with the DIP switch.

- 1. Turn ON the Master and Slave power supplies. At this point, the 1/100 Display Mode will not be enabled.
- 2. On the Setting Tool, double-click the icon of the Unit to be set and open the Edit Device Parameters Dialog Box.

mental Temperature Input 0 Tempe	rature Input 1 Data comparison between channels

Upload Download	Qompare Beset

- 3. Select *Temperature Data (1/100)* from the pull-down menu in the *Default Connection Path (In)* Field, and then click the **Download** Button and the **Reset** Button.
- **Note** In 1/100 Display Mode, the temperature data will be converted to two places below the decimal even though the actual resolution is not 0.01°C (or °F). Consequently, the 0.1°C/ °F or 0.01°C/ °F display digits may jump back and forth between values. Treat any values displayed beyond the specified input resolution as reference data.

Dimensions

6-4-3 I/O Data Allocation Methods

Either the default settings (i.e., the temperature input values) can be used, or the Setting Tool can be used to allocate Status Flags or other settings other than the temperature input value.

Using the Default Settings

When the Temperature Input Unit's default settings are used, only the temperature input values are selected as I/O data. Two words (four bytes) are allocated in the Master's Input Area, as shown in the following diagram.

1	5	

15		0
	Temperature Input Value for Input 0	
	Temperature Input Value for Input 1	

Setting Data Using a Setting Tool

Temperature data can be combined with other data, such as Status Flags, as shown below, and allocated as I/O. The Setting Tool can be used to select the desired data from a pull-down list.

Example: Allocating Temperature Data + Top/Valley Detection Timing Flags

15	8	7	0	
	Temperature	Data for Input 0		
Temperature Data for Input 1				
Top Detection	Fiming Flag	Valley Detection Timing Flag	3	

The Setting Tool is used as described below to allocate data.

Setting Temperature Data (Example: DeviceNet Configurator)

In the Network Configuration Window for the Slice I/O Terminal, double-click the icon of the Slice I/O Terminal that is to be set. Alternatively, right-click the icon and select *Parameters - Edit*. The Edit Device Parameters Window will be displayed.

2. Select the Temperature Input Unit to be edited from the *I/O Module* Tab Page.

I/O Data

Temperature Data Normal Display Mode (Temperature Data) Temperature data is used to monitor temperature input values. The temperature input values are allocated as the default settings, but any one of the following can be allocated: temperature input value, peak value, bottom value, top value, valley value, or rate of change.

Note The comparator function can be used for the data allocated as the Temperature Data.

The data format used for allocating data in the Master is shown below. Data is allocated as two's complements (4 bytes = 2 words).

15

15	U
Temperature Data for Input 0	
Temperature Data for Input 1	

Temperature Data 1/100 Display Mode (Temperature Data (1/100))

This format is used to allocate temperature data in 1/100 Display Mode. The data format used when allocated in the Master is shown below. The data is given as two's complements (8 bytes = 4 words).

15

15		U
	Temperature Data for Input 0	
	Temperature Data for Input 0	
	Temperature Data for Input 1	
	Temperature Data for Input 1	

Top/Valley Detection Timing Flags (Shot Status) These flags turn ON for the one-shot time when detecting the top or valley for the top/valley hold function.

These flags are used to time reading the values held as the top and valley values at the Master. The following data format is used when these flags are allocated in the Master (2 bytes = 1 word).

	Bit 7	Bit 6	Bit 5	Bit 4	Bit 3	Bit 2	Bit 1	Bit 0
+0	0	0	0	0	0	0	V_ST1	V_ST0
+1	0	0	0	0	0	0	T_ST1	T_ST0

n

The details of each byte are shown in the following table.
--

Byte	Abbreviation	Name	Details
+0	V_STx	Valley Detection Tim- ing Flag	Turns ON when a valley is detected by the valley hold function and then turns OFF after the one-shot time has elapsed.
+1	T_STx	Top Detection Timing Flag	Turns ON when a top is detected by the top hold func- tion and then turns OFF after the one-shot time has elapsed.

Note The one-shot time can be changed. For details, refer to the one-shot time settings for the top/valley hold function.

Temperature Status Flags (Temperature Status) The Temperature Status Flags include allocations for the Comparator Result Flag, the Top/Valley Detection Timing Flags, and the Off-wire Detection Flags. These flags are used for detection and monitoring.

The data format used for each byte when these flags are allocated in the Master is shown below (2 bytes = 1 word).

0	10		
	LU	LL0	Input
	1.4		0
.1	L1	LL1	Input 1
.1	L1		LL1

The details for each bit are shown in the following table.

Bit	Abbrevi- ation		Name	Details
0	LLx	Compara- tor result	Low Low Limit Alarm Flag	Turns ON when the value of data allocated in Temperature Data drops below the Low Low Limit alarm setting.
1	Lx		Low Limit Alarm Flag	Turns ON when the value of data allocated in Temperature Data drops below the Low Limit alarm setting.
2	PSx		Normal Flag (pass signal)	Turns ON when none of the alarms (High High Limit, High Limit, Low Low Limit, and Low Limit) have been output.
3	Hx		High Limit Alarm Flag	Turns ON when the value of data allocated in Temperature Data exceeds the High Limit alarm setting.
4	HHx		High High Limit Alarm Flag	Turns ON when the value of data allocated in Temperature Data exceeds the High High Limit alarm setting.

Temperature Input Unit

Bit	Abbrevi- ation		Name	Details
5	V_STx	Top/val- ley detec-	Valley Detec- tion Timing Flag	Used with the valley hold func- tion.
		tion timing		Turns ON when a valley is detected, and turns OFF after the one-shot time has lapsed.
6	T_STx		Used with the top hold function.	
			Timing Flag	Turns ON when a top is detected, and turns OFF after the one-shot time has lapsed.
7	BWx	Off-wire Detection Flag		Turns ON when a disconnection is detected.

Temperature Data Normal Mode + Top/Valley Detection Timing Flags (Temperature Data + Shot Status) This data pattern consists of the Temperature Data Normal Display Mode followed by the Top/Valley Detection Timing Flags and is allocated in the Master using the following data format (6 bytes = 3 words).

	Bit 7	Bit 6	Bit 5	Bit 4	Bit 3	Bit 2	Bit 1	Bit 0		
+0	Temperature Data for Input 0									
+1										
+2	Temperature Data for Input 1

Hold Flags (Output)

Hold Flags are used with the peak/bottom hold and top/valley hold functions. The Hold Flags are used to control the hold execution timing from the Master and are allocated in the Master using the following data format (2 bytes).

Note A delay may occur between when the Master's power is turned ON until notification of the Hold Flag status is sent to the Unit.

	Bit 7	Bit 6	Bit 5	Bit 4	Bit 3	Bit 2	Bit 1	Bit 0
+0							HD1	HD0
+1								

The details for each bit are shown in the following table.				
Bit	Abbreviation	Name	Details	
0	HD0	Hold Flag for Input 0	The hold function is performed for Tem- perature Input 0 while this flag is ON. The hold function stops and the last value is held when the flag goes OFF.	
1	HD1	Hold Flag for Input 1	The hold function is performed for Tem- perature Input 1 while this flag is ON. The hold function stops and the last value is held when the flag goes OFF.	

The details for each bit are shown in the following table.

Selecting the Temperature Data

The temperature data can be selected from six types of data (temperature input value, peak value, bottom value, top value, valley value, and rate of change) obtained from math processing. The selected data can be allocated for the Master either individually or in combination with Status Flags.

Use the following method to select the temperature data type.

Selecting the Temperature Data (Example: DeviceNet Configurator)

- In the Network Configuration Window for the Slice I/O Terminal to be set, double-click the icon of the Slice I/O Terminal that is to be set. Alternatively, right-click the icon and select *Parameters - Edit*. The Edit Device Parameters Window will be displayed.
 - 2. Select the Temperature Input Unit to be set from the *I/O Module* Tab Page, and click the **Edit** Button. The Edit Unit Parameters Window will be displayed.
 - 3. Open the tab page for the input for which temperature data is to be selected, and select from the pull-down list the type of data to be allocated as the Temperature Data.

6-4-4 Functions and Settings

Moving Average
ProcessingThis function calculates the average value (moving average) of the previous
eight inputs, and uses the resulting value as conversion data. When the input
value fluctuates frequently, averaging can be used to produce a stable input
value, as shown in the following diagram.

Setting Procedure (Example: DeviceNet Configurator)

- In the Network Configuration Window, double-click the icon of the Slice I/O Terminal that is to be set. Alternatively, right-click the icon and select *Parameters - Edit*. The Edit Device Parameters Window will be displayed.
 - 2. Select the Temperature Input Unit to be edited from the *I/O Module* Tab Page.
 - 3. Click the **Edit** Button on the *I/O Module* Tab Page. The Edit Unit Parameters Window will be displayed.
 - 4. Select the tab page for the input where moving average processing is to be performed, and select the *Moving Average* Check Box in the *Function Choice* Area.

- 6. Click the OK Button to exit.

Scaling

Scaling can be used to change the values displayed for the temperature input values to any values required by the user. Scaling eliminates the need for ladder programming in the Master to perform math operations. To scale the temperature input values (i.e., the measured values) to the values required by the user, conversion values between -28,000 and 28,000 are set at 2 points (i.e., 100%, and at 0%) using the Configurator.

Note

(1) The default values are 0 to 28000.

(2) Reverse scaling, where the 0% scaling value is higher than the 100% scaling value, is also supported.

Offset Compensation Offset compensation can be used to compensate for error that occurs during scaling. The offset amount is added to the scaled line after scaling, as shown in the following diagram. The offset (error) value can be input between -28,000 to 28,000, but be sure that underflow or overflow does not occur. The upper limit is 7FFE hex and the lower limit is 8000 hex. (In 1/100 Display Mode the upper limit is 7FFFFFE hex and the lower limit is 80000000 hex.)

Setting Procedure (Example: DeviceNet Configurator)

- **1,2,3...** 1
 - In the Network Configuration Window, double-click the icon of the Slice I/O Terminal that is to be set. Alternatively, right-click the icon and select *Parameters - Edit*. The Edit Device Parameters Window will be displayed.
 - 2. Select the Temperature Input Unit to be edited from the *I/O Module* Tab Page.
 - 3. Click the **Edit** Button on the *I/O Module* Tab Page. The Edit Unit Parameters Window will be displayed.

4. Select the tab page for the input where scaling is to be performed, and select the *Scaling* Check Box in the *Function Choice* Area.

Peak/Bottom Hold The peak/bottom hold function is used to hold the maximum (peak) value or minimum (bottom) value of the temperature input value. When the Hold Flag (output) allocated in the Output Area turns ON, the hold function starts, searching for the peak or bottom value until the Hold Flag turns OFF. (The peak/bottom value is refreshed when the Hold Flag turns OFF.) The comparator function can be used to compare the peak or bottom values allocated as temperature data. (Refer to details on the comparator function.)

Example of Bottom Hold

Note A delay in network transmission time will occur from the time the Hold Flag turns ON (or OFF) in the Master's ladder program until notification of the flag's status is actually sent to the Slave. Therefore, even when the Hold Flag is ON, the first temperature data transmitted to the Master when the CPU Unit power is turned ON may be the data from when the Hold Flag was OFF. To collect peak/bottom hold data using the Hold Flag at the Master, configure a ladder program that considers the transmission delay when the Hold Flag is turned ON, then enables the peak/bottom hold values after a fixed time interval.

Setting Procedure (Example: DeviceNet Configurator)

- In the Network Configuration Window, double-click the icon of the Slice I/O Terminal that is to be set. Alternatively, right-click the icon and select *Parameters - Edit*. The Edit Unit Parameters Window will be displayed.
 - 2. Select the Temperature Input Unit to be edited from the *I/O Module* Tab Page.

8. Click the OK Button to exit.

Top/valley hold is used to hold the top and valley values of the temperature input value.

Temperature values that fluctuate more than twice the hysteresis value are monitored, and the top or valley values are held. The top or valley value is allocated along with the Top/Valley Detection Timing Flags, which can be used to check the hold timing.

When the Hold Flag (output) allocated in the Output Area turns ON, the hold function starts, refreshing the top or valley value until the Hold Flag turns OFF. (The last value is held when the Hold Flag turns OFF, but the next time the Hold Flag turns ON, the hold value is initialized as soon as a top or valley occurs.) The comparator can be used to compare the top or valley value allocated as temperature data. (Refer to details on the comparator function.)

Example of Valley Hold

Note 1. A delay in network transmission time will occur from the time the Hold Flag turns ON (or OFF) in the Master's ladder program until notification of the flag's status is actually sent to the Slave. Therefore, even when the Hold Flag is ON, the first temperature data transmitted to the Master when the CPU Unit power is turned ON may be the data from when the Hold Flag

Section 6-4

was OFF. To collect top/valley hold data using the Hold Flag at the Master, configure a ladder program which considers the transmission delay time when the Hold Flag is turned ON, then enables the top/valley hold values after a fixed time interval.

- 2. The time that the Top/Valley Detection Timing Flags are ON can be adjusted by setting the one-shot time. Use the Configurator to set the one-shot time (the setting range is 1 to 65535 ms).
- 3. If the Hold Flag turns OFF during the time the Top/Valley Detection Timing Flag is set to be ON, both flags will turn OFF simultaneously.

Setting Procedure (Example: DeviceNet Configurator)

- In the Network Configuration Window, double-click the icon of the Slice I/O Terminal that is to be set. Alternatively, right-click the icon and select *Pa-rameters - Edit*. The Edit Device Parameters Window will be displayed.
 - 2. Select the Temperature Input Unit to be edited from the *I/O Module* Tab Page.
 - 3. Click the **Edit** Button on the *I/O Module* Tab Page. The Edit Unit Parameters Window will be displayed.
 - 4. Select the tab page for the input where top/valley hold is to be set, and select the *Top/Valley Hold* Check Box in the *Function Choice* Area.

Hysteresis Setting The hysteresis value can be set using the Configurator to prevent detection of top or valley values that occur due to minor fluctuations in the temperature input value. This will cause the start of data holding to be delayed after the actual top or valley value occurs, as shown in the following diagram.

Timing for Setting Data

Setting Hysteresis (Example: DeviceNet Configurator)

1,2,3... 1. Input the value for hysteresis in the *Hysteresis* Field in the **Top/Valley** Tab in the *Function Choice* Area.

Top/Valley Counter Function

This function counts the number of temperature tops or valleys in devices or applications that have repetitive temperature rises (or drops). A threshold value can be set for the counter to indicate when preventative maintenance is required for the Unit or sensors. The Over Threshold status can be read in the Maintenance Information Window or by using an explicit message.

Valley Counter Operation

Setting Procedure (Example: DeviceNet Configurator)

- In the Network Configuration Window, double-click the icon of the Slice I/O Terminal that is to be set. Alternatively, right-click the icon and select *Parameters - Edit*. The Edit Device Parameters Window will be displayed.
 - 2. Select the Temperature Input Unit to be edited from the *I/O Module* Tab Page.
 - 3. Click the **Edit** Button on the *I/O Module* Tab Page. The Edit Unit Parameters Window will be displayed.

Rate of Change Calculation

The rate of change can be obtained for each sampling cycle set for the temperature input data. This function calculates the difference between each set sampling cycle and value obtained in the previous cycle. The sampling cycle can be set between 250 ms and 65,500 ms in 250-ms increments. The default setting for the sampling cycle is 250 ms.

Note If the sampling cycle is set to a small value, the rate of change will be sensitive to small changes. If the temperature data is subject to minute fluctuations, and the sampling cycle is shorter than the cycle of fluctuation, the fluctuation will

be regarded as the rate of change. To prevent this occurring, use moving average processing, which will set a longer sampling cycle.

Setting Procedure (Example: DeviceNet Configurator)

- In the Network Configuration Window, for the Slice I/O Terminal, double-click the icon of the Slice I/O Terminal that is to be set. Alternatively, right-click the icon and select *Parameters Edit*. The Edit Device Parameters Window will be displayed.
 - 2. Select the Temperature Input Unit to be edited from the *I/O Module* Tab Page.
 - 3. Click the **Edit** Button on the *I/O Module* Tab Page. The Edit Unit Parameters Window will be displayed.
 - 4. Select the Tab Page for the input where rate of change is to be set, and select the *Rate of Change* Option in the *Function Choice* Area.

Comparator

When the High High Limit, High Limit, Low Low Limit, and Low Limit are set in the Unit, a Status Flag will turn ON when a value exceeds a setting range. The four set values are High High Limit (HH), High Limit (H), Low Low Limit (LL), and Low Limit (L), and the values can be compared with those in Temperature Data.

The setting range is from -415000 to 415000.

When any of these values is exceeded, the Comparator Result Flag in the area for Temperature Status Flags turns ON. If an alarm does not occur, the Normal Flag (pass signal) turns ON.

Note If the temperature input value changes faster than the conversion cycle, the High Limit alarm may turn ON without the Normal Flag (pass signal) turning ON for the Low Limit alarm. Configure ladder programs to prevent this occurring.

Temperature Input	Unit	Section 6-4
Setting Hysteresis		The Comparator Result Flag turns OFF when the value is lower than the hys- teresis width (H or HH alarm occurs) or exceeds it (L or LL alarm occurs), as shown in the following diagram. If the temperature value fluctuates around the threshold, and the flag repeatedly turns ON or OFF, setting hysteresis will sta- bilize the flag operation. The setting range is from 0 to 16383.
		HH set value or H set value LL set value or L set value LL Alarm Flag or
		HH Alarm Flag or L Alarm Flag H Alarm Flag
	Note	When setting the hysteresis value, adjust for each input's decimal point posi- tion and the 1/100 Display Mode (if it is being used). Always correct the hys- teresis value after changing the display mode setting or changing to an input that has a different decimal point position.
OFF Delay		The time until the Comparator Result Flag turns OFF can be extended. For example, even if the Flag is ON momentarily, the OFF delay can be set so that the Master can receive notification of the Flag's status.
		HH set value Hysteresis width
		OFF delay
		HH Alarm Flag

- 7. Return to the **General** Tab, click the **Download** Button, and then click the **Reset** Button to reset the Unit.
- 8. Click the **OK** Button and exit the window.

This function can be used to compare the temperature values between the two inputs (inputs 0 to 1) to monitor the relative temperature difference. A threshold value can be set to detect an excessive temperature difference for preventative maintenance in devices in which the temperature difference may cause or indicate a problem.

The comparison result and over-threshold status can be read in the Maintenance Information Window.

- **Note** 1. The comparison operation can be performed only on the data set as temperature data.
 - 2. If the peak value or bottom value is selected as the temperature data, the processed peak or bottom value will be used in the comparison operation and not the actual temperature input value.

Data Comparison between Channels

3. The comparison result will be read to a precision of 0.01, regardless of the setting.

Setting Procedure (Example: DeviceNet Configurator)

- In the Network Configuration Window, double-click the icon of the Slice I/O Terminal that is to be set. Alternatively, right-click the icon and select *Parameters - Edit*. The Edit Device Parameters Window will be displayed.
 - 2. Select the Temperature Input Unit to be edited from the *I/O Module* Tab Page.
 - 3. Click the **Edit** Button on the *I/O Module* Tab Page. The Edit Unit Parameters Window will be displayed.
 - 4. Select the Data comparison between channels Tab.

No.	Calculation Data1	Calculation Data2	Threshold Value
00	Temperature Input 1	Temperature Input 0	1
01	Temperature Input 0	Temperature Input 1	0

5. Double-click the Calculation Data1 or Calculation Data2 header cell to open the Edit Calculation Data Window. Select the two temperature inputs to be compared from the pull-down menus in the Calculation Data1 and Calculation Data2 Fields. The comparison will be calculated by subtracting Calculation Data2 from Calculation Data1. Set a threshold value in the Threshold Value Field. Always set the threshold value to a precision of

0.01. For example, when setting 10°C, input 1000 for 10.00°C.

- 6. Return to the **General** Tab, click the **Download** Button, and then click the **Reset** Button to reset the Unit.
- 7. Click the **OK** Button and exit the window.
- 8. The comparison results can be checked in the Maintenance Information Window or **Data comparison between channels** Tab.

Disabling Input Error Detection Input error detection can be disabled for unused inputs so that input errors, including Off-wire conditions, will not be detected. If input error detection is disabled, the Temperature Input Warning Flag and Off-wire Detection Flag will remain OFF regardless of whether there is a broken or disconnected input wire, or the temperature has exceeded the convertible range. The value of the temperature data will be set to 7FFF hex, just as it is when an Off-wire condition is detected. (The value of the temperature data in 1/100 Display Mode will be 7FFFFFFF.)

Disabling Error Detection (Example: DeviceNet Configurator)

- In the Network Configuration Window, double-click the icon of the Slice I/O Unit that is to be set. Alternatively, right-click the icon and select *Parameters* - *Edit*. The Edit Device Parameters Window will be displayed.
 - 2. Select the Temperature Input Unit to be edited from the *I/O Module* Tab Page.
 - 3. Click the **Edit** Button on the *I/O Module* Tab Page. The Edit Unit Parameters Window will be displayed.
 - 4. Select the *Disable Input Error's Detection* Check Box in the *Function Choice* Area.

☐ Moving Average ☐ Peak/Bottom ☐ Scaling ☐ Top/Valley ☐ Cumulate Range/Data Allocation	Comparator Fate of Change ed Count Oisable Input Error's Detection
Parameter Name	Value
0000 Input Type	PT100(-200.0to850.0C/-300.0to1500.0F)
0001 Temperature Data Allocation	Raw Value
Help NOTE! Input Type isn't enabled only by changing this parameter. RESET or re- start is required.	Default : PT100(-200.0to850.0C/- 300.0to1500.0F)

- 5. Return to the **General** Tab, click the **Download** Button, and then click the **Reset** Button to reset the Unit.
- 6. Click the OK Button to exit.

Note	 (1) If an input is not being used, an input error will occur and an over range error and off-wire condition will be detected. This will cause the Temperature Input Warning Flag in the Warning Status Area and the Off-wire Detection Flag in the Alarm Status to turn ON. If the Temperature Status Flag is used, the Off-wire Detection Flag will turn ON. In addition, the ERR indicator will light. (2) Disable detecting input errors only for inputs that are not being used. If this function is used when a sensor is connected, input errors and Off-wire conditions will not be detected.
<u>Off-wire Detection</u>	If an input sensor is disconnected, the Temperature Input Warning Flag in the Warning Status Area and the Off-wire Detection Flag in the Alarm Status Area will turn ON. If the Temperature Status Flags are being used, the Off-wire Detection Flag for the input where the sensor is disconnected will turn ON. If off-wire detection is enabled, the value of the conversion data will be set to 7FFF hex. (The value in 1/100 display mode will be 7FFFFFFF.) If the input temperature returns to the convertible range, the off-wire detection function will be reset automatically and normal conversion data will be stored.
<u>Last Maintenance</u> Date	The last maintenance date can be set in the Unit separately for the Unit and the connected devices. It enables the user to easily determine the next maintenance date. The date can be set using the Configurator.

Setting Procedure (Example: DeviceNet Configurator)

Setting the Last Maintenance Date of the Unit

- In the Network Configuration Window, double-click the icon of the Slice I/O Terminal that is to be set. Alternatively, right-click the icon and select *Pa-rameters - Edit*. The Edit Device Parameters Window will be displayed.
 - 2. Select the Temperature Input Unit to be edited from the *I/O Module* Tab Page.
 - 3. Click the **Edit** Button on the *I/O Module* Tab Page. The Edit Unit Parameters Window will be displayed.
 - 4. Click the **General** Tab, and select the applicable date from the pull-down menu in the *Last Maintenance Date* Field. (To enter the current date, select *Today*, which is at the bottom of the pull-down menu.)

<u>Temperature</u> <u>Cumulative Counter</u> (Cumulated Count)

The cumulative counter calculates an approximation of the integral of the temperature input value over time to calculate the heat exposure to sensors or equipment. Either hours (°C (°F) × hours) or minutes (°C (°F) × minutes) can be selected. For example, a cumulated count of "100.0" indicates a value equivalent to a temperature input value of 100°C (°F) for one hour, if hours has been selected as the unit.

The cumulated count is stored in a 4-byte (2-word) area according to the set unit for 300 divisions (See notes 1 and 2.).

A threshold value can be set to monitor the cumulated count. If the cumulated count exceeds the threshold value, the Cumulative Counter Flag in the Warning Status Area will turn ON and the *Threshold Cumulated Counter Over* Status Check Box in the Maintenance Window will be selected.

Note

- (1) If °F is selected, the integration will be performed on the °F values.
- (2) If the 1/100 Display Mode is selected, integration will be performed on the 100 times the binary data.

(3) The meaning of the cumulated count depends on the decimal point position of the temperature value.

Note The following table shows the divisions for the cumulative counter.

Unit	Divisions	Number of integrations
Hour	12 s	300 times
Minute	200 ms	300 times

Setting Procedure (Example: DeviceNet Configurator)

- **1,2,3...** 1
- In the Network Configuration Window, double-click the icon of the Slice I/O Terminal that is to be set. Alternatively, right-click the icon and select *Parameters - Edit*. The Edit Device Parameters Window will be displayed.
 - 2. Select the Temperature Input Unit to be edited from the *I/O Module* Tab Page.
 - 3. Click the **Edit** Button on the *I/O Module* Tab Page. The Edit Unit Parameters Window will be displayed.
 - 4. Select the tab page for the input where the cumulative counter is to be set, and select the *Cumulated Count* Check Box in the *Function Choice* Area.

- 8. Click the **OK** Button to exit.

User Adjustment

A user adjustment can be set to compensate for an offset in the input value caused by factors such as the characteristics and connection methods of the input sensor.

Note

- (1) Temperature Input Units are properly adjusted at the factory before shipment, so it is normally unnecessary to make adjustments. Use the user adjustment only when absolutely necessary. OMRON is not responsible for the results of user adjustment. If a mistake is made in the adjustment, the adjustment data can be cleared to return to the factory default settings.
 - (2) The Temperature Input Unit continues the temperature conversion operations even after user adjustment has been made. It is possible for temperature data values to change suddenly from previous values after the user adjustment is made, so always consider the effects on the operating environment before applying the user adjustment.

Adjustment Procedure for the GRT1-TS2T

Use the following procedure to adjust the Temperature Input Terminal. Follow the flowchart closely for proper adjustment.

Section 6-4

Note The only sensors that can be adjusted are ones that operate while the power supply is ON. When adjusting for sensors that are not presently in use, change the input type setting, toggle the power supply or reset the Unit from the Configurator, and perform the adjustment procedure from the beginning of the flowchart.

Connecting the Devices required for GRT1-TS2T Adjustment

The following paragraphs explain how to connect the devices that must be connected to the GRT1-TS2T for user adjustment. Wire the following devices properly when adjusting the GRT1-TS2T.

Reference Voltage/Current Generator (STV) and Precision Digital <u>Multimeter (DMM)</u>

Used to make adjustments at the upper limit and lower limit.

Prepare devices that can generate accurate 0 mV, 20 mV, and 50 mV voltages. Use a precision digital multimeter that can measure the output voltage and indicate when the voltage/current generator is not producing an accurate voltage output.

Cold Junction Compensator (such as a ZERO-CON) and Compensating Conductors

Used to adjust the bias compensation value.

The cold junction compensator (the ZERO-CON is used in following examples) is a device that maintains an accurate $0^{\circ}C$ ($32^{\circ}F$) temperature for thermocouple sensors. Use a cold junction compensator compatible with the sensor being adjusted.

Note When using an R, S, E, B, or W type thermocouple, a K type can be substituted. Set the ZERO-CON to 0°C (32°F).

Adjustment Device Connection Diagram

Connect the reference voltage/current generator (STV), precision digital multimeter (DMM), and cold junction compensator to the input terminals. In the following examples, the devices are connected to input 1, but connect to the corresponding terminals when adjusting input 2.

DeviceNet

Note The personal computer (Configurator) is connected through DeviceNet in the diagram above. If a CS1W-DRM21 or CJ1W-DRM21 Master Unit is being used, the Configurator can also be connected through the Master Unit using a peripheral bus connection. Refer to *5-1 Switching between Online and Offline* in the *DeviceNet Configurator Operation Manual* (Cat. No. W382) for details.

Input Terminal Connections

Upper/Lower Limit Compensation Wiring Bias Compensation Wiring

Checking the Wiring and Making Adjustments

■ Adjusting the GRT1-TS2T's Upper and Lower Limit Values

- **1,2,3...** 1. Wire the Unit as shown above for upper/lower limit compensation. To connect a high-precision digital multimeter (DMM), use 2-wire ferrules.
 - 2. Check the sensor and input type being used.
 - Note When using an R, S, B, E, or W sensor, use a K thermocouple's compensating conductors. In addition, when using an R, S, or B type sensor, set the input type as K (0.0 to 500.0°C). When using an E or W type sensor, set the input type as K (–300 to 1,300°C).
 - 3. Connect the Configurator to the DeviceNet network and go online.
 - 4. Upload settings to the Configurator.
 - 5. Turn ON the power supplies of all Units, including the Temperature Input Terminal to be adjusted. Wait approximately 30 minutes for the Temperature Input Terminal's internal temperature to stabilize.
 - Double-click the icon of the Temperature Input Terminal to be set in the Main Window and open the Edit Device Parameters Window. (From the Maintenance Mode Window, click the right mouse button over the Slave icon and select *Parameters* and *Edit*.)

208

7. Select the Tab Page for the input that will be adjusted and click the **Adjustment** Button to open the Adjustment Window.

dit Device Parameters		X

Т	20 mV
L (-100 to 850°C)	50 mV
L (0.0 to 400.0°C)	20 mV
U	20 mV
Ν	50 mV
PL2	50 mV

11. Click the **Fix upper adjusting Value** Button. The upper limit adjustment value will be stored in the Unit.

- 12. To check whether the user adjustment values have been accepted and the Unit is operating with adjustment values different from the factory defaults, click the right mouse button over the Slave icon and select *Maintenance Information* to open the Maintenance Information Window. Select the Tab Page for the input that was adjusted. If there is a check in the *User Adjustment* Box (bottom right box), the Unit is operating with user-set adjustment values.
- Note 1. When checking whether or not the user adjustment values have been set correctly, always refresh the data by clicking the Update Button in the Maintenance Information Window's General Tab or uploading the settings again. For details on the Maintenance Information Window, refer to 6-3 Maintenance Information Window.
 - 2. If the correct reference voltage was not input, the adjustment values may not be accepted.

Adjusting the GRT1-TS2T's Bias Compensation Value

- *1,2,3...* 1. Remove the wiring for upper/lower limit compensation and wiring the Unit as shown for bias compensation.
 - 2. After completing wiring, wait until the temperature data stabilizes (i.e., until there is no change in the temperature data for at least 20 minutes). Depending on the system setup, this may take over 60 minutes. When the temperature data is stable, click the **Fix Bias adjusting Value** Button.

Adjustment			
Bias compensation Fix <u>B</u> ias adjusting Value			
Default Setting Close			

- Note 1. The bias compensation value may not be accepted if there is a large temperature difference between the Terminal Block and ZERO-CON (0°C bath). If this problem occurs, correct the adjustment system by using a ZE-RO-CON compatible with the sensor being adjusted or other means.
 - 2. Always test the indication accuracy after making user adjustments to verify that the adjustments are correct. Test the indication accuracy at three points: the lower limit value, an intermediate value, and the upper limit value.
 - Connect the external devices as shown in the following diagram.
 - After verifying that the ZERO-CON is set to 0°C, set the STV's output voltage to produce a voltage equivalent to the test voltage.
 - **Note** Always use the compensating conductors (the same kind that will be used with the sensor being adjusted) to connect the ZERO-CON to the GRT1-TS2T's input terminals.

Note In order to perform the adjustment procedure properly, always allow sufficient time for temperature stabilization, as shown in the following diagram. Also allow sufficient time for devices such as the STV, DMM, and ZERO-CON to stabilize. Refer to each device's operating manual for details.

Stabilization Times Required in Each Step

The following diagram shows the stabilization times (waiting times) required when adjusting both inputs.

Temperature Input Unit

Section 6-4

Note The terminal block temperature stabilization time does not affect the upper/lower limit adjustment, so the adjustment can be performed immediately if 30 minutes have passed since the Temperature Input Terminal's power was turned ON.

Note Only sensors that operate while the power supply is ON can be adjusted. When adjusting for a sensor that is not presently in use, change the input type setting and perform the adjustment procedure from the beginning of the flowchart.

Connecting the Devices Required for Adjustment

This section explain how to connect the devices that must be connected to make a user adjustment. Wire the following devices properly before making an adjustment.

Six-dial Resistance Box and Precision Digital Multimeter

These are used to make adjustments at the upper limit and lower limit. Prepare devices that can provide accurate resistance values for measurement. Use a precision digital multimeter that can measure the resistance values and indicate when the six-dial resistance box is not producing an accurate resistance.

Adjustment Device Connection Diagram

Connect the six-dial resistance box to the input terminals. In the following example, the device is connected to input 0, but connect to the input 1 terminals when adjusting input 1.

- Note
- (1) When connecting the six-dial resistance box, use a cable with the same gauge as the one that will be used for operation.
 - (2) The personal computer running the Configurator is connected through DeviceNet in the above diagram. If a CS1W-DRM21 or CJ1W-DRM21 is being used, the Configurator can also be connected through the Master Unit using a peripheral bus connection. Refer to 5-1 Switching between Online and Offline in the DeviceNet Configurator Operation Manual (Cat. No. W382) for details.

Section 6-4

Checking the Wiring and Making Adjustments

Adjusting the Upper and Lower Limit Values

- Set the resistance value on the six-dial resistance box equivalent to the test value and properly wire the box to the input of the Temperature Input Unit that is being adjusted.
 - 2. If the correct resistance cannot be obtained, properly wire the digital multimeter to the six-dial resistance box and measure the resistance.
 - 3. Connect the Configurator to the DeviceNet network and go online.
 - 4. Upload settings to the Configurator.
 - 5. Turn ON the power supplies of all Units, including the Temperature Input Unit to be adjusted. Wait approximately 30 minutes for the Temperature Input Unit's internal temperature to stabilize.
 - Double-click the icon of the Temperature Input Unit to be set in the window to open the Edit Unit Parameters Window. (From the Maintenance Mode Window, click the right mouse button over the icon and select *Parameters* - *Edit.*)
 - 7. Select the tab page for the input that will be adjusted and click the **Adjustment** Button to open the Adjustment Window.

7-1 Overview

This section provides an overview of the GRT1-CT1 and GRT1-CT1-1 Counter Units and the GRT1-CP1-L Positioning Unit.

7-1-1 Counter Units and Positioning Unit

The GRT1-CT1(-1) Counter Units and GRT1-CP1-L Positioning Unit provide special functions in addition to the backup, restore, and other functions common to GRT1-series Slice I/O Units. The special functions include counting functions, counter value comparison ranges, and a digital input that can be set to control the counter.

Counter data, such as the Present Counter Value or the value in the Preset Value Register, can be assigned as I/O data along with status information. The Setting Tool can be used to allocate status data, to set functions specific to the Counter Units/Positioning Unit, and to perform monitoring.

7-1-2 List of Data Processing Functions

The following table lists the data processing functions that can be used with Counter Units and Positioning Units. Refer to 7-4-4 Functions and Settings and 7-5-4 Functions and Settings for details on functions and setting methods.

Function	Details	Default
Counter	Each Counter Unit or Positioning Unit provides one counter that operates according to the mode set by the user.	Always enabled.
Digital I/O	One input and one or two outputs can be used to control and monitor the counter.	IN: No action. OUT, OUT0, and OUT1: Assigned to comparison ranges.
Comparison ranges	A range can be set to control a digital output. When the counter value is within the range, the output will turn ON or OFF according to the relationship between the counter value and the comparison range. There is one comparison range for each digital output.	No ranges are set.
Reset	The counter can be reset by using the digital input or by using a user command in I/O data.	Disabled.
Preset	The counter can be preset to a specific value by using the digital input or by using a user command in I/O data.	Disabled.
Capture	The Present Counter Value can be stored in memory. The stored value can be retrieved at any time. The counter value can be captured by using the digital input or by using a user command in I/O data.	Disabled.
Z-reset	The counter can be reset on the rising edge of the Z input according to the user setting. The same input is shared between the Z input and the digital input in the Counter Units, but separate Z and digital inputs are provided in the Positioning Unit.	Disabled.
Counter frequency	The frequency of the counter input pulse can be measured. The mea- sured frequency is calculated as the Present Counter Value minus the counter value from one second ago. The counter value is sampled every 0.1 s.	Always enabled.
	All sampled counter data is set to 0 or to the preset value when the counter value is reset or preset, and the frequency measurement is started again.	
Action on bus error	The action that is taken when a SmartSlice bus error occurs can be set. The digital outputs can be cleared or maintain their normal functionality. The counter continues to operate normally even when an error occurs.	Outputs cleared.

GRT1-CT1(-1) Counter Units and GRT1-CP1-L Positioning Units

Function	Details	Default
Action on bus idle	The action that is taken when the SmartSlice bus goes idle can be set. The digital outputs can either be cleared or their maintain functionality. The counter continues to operate normally.	Outputs cleared.
Last maintenance date	The date of the last time Unit maintenance was performed is recorded.	2005/1/1

7-1-3 I/O Data

Counter Units and Positioning Units have both input and output data. Three words are allocated for the Master's Output Area as output data from the Master to the Unit and three words are allocated for the Master's Input Area as input data from the Unit to the Master. See 7-4-3 I/O Data Details for detailed information on the I/O data.

Input Data

I/O data	Details
Counter data and status data (6 input bytes)	 Used to monitor counter data. Provides counter Status Flags.

Output Data

I/O data	Details
Counter settings and control data (6 output bytes)	Used to set up and control the counter.

7-2 Status Areas

A Counter Unit or Positioning Unit has two status areas. The Unit's Status Flags are turned ON and OFF based on the threshold/monitor values set for the functions in the Unit. A flag in the Communications Unit will be turned ON only when the corresponding flag has been turned ON in one of the status areas.

The Communications Unit's Status Flag information is transmitted to the Master. The Counter Unit's or Positioning Unit's status area can be read from a Programming Device.

Warning Status Area

The Counter Unit's or Positioning Unit's Warning Status Area contains the following 16 bits. The Warning Status Area provides notification of minor errors in the Unit. When any of the flags turns ON, bit 2 of the Communications Unit's Status Flags is turned ON and that information is transmitted to the Master.

Bit	Content	Description
0	Reserved	
1	Reserved	
2	Reserved	
3	Unit Maintenance Flag OFF: Normal ON: Error (Monitor value exceeded.)	Monitors the power ON time warning value set for the Unit Conduction Time Monitor function.
4	Reserved	
5	Reserved	
6	Reserved	
7	Reserved	
8	Reserved	
9	Connected Device Maintenance Flag OFF: Within range (all points below set value) ON: Out-of-range (one or more points exceeded set value)	Monitors the warning value set for the Contact Operation Counter or Total ON Time Monitor function.
10	Reserved	
11	Reserved	
12	Reserved	
13	Reserved	
14	Reserved	
15	Reserved	
16	Reserved	

Alarm Status Area

The Counter Unit's or Positioning Unit's alarm status area contains the following 16 bits. The Alarm Status Area provides notification of serious errors in the Unit. The flags indicate non-fatal errors in the Unit. When any of these flags turns ON, bit 3 of the Communications Unit's Status Flags is turned ON and that information is transmitted to the Master.

Bit	Content	Description
0	Reserved	
1	EEPROM Data Error Flag	OFF: Normal ON: Error occurred
2	Reserved	
3	Reserved	
4	Reserved	
5	Reserved	
6	Reserved	
7	Reserved

7-3 Maintenance Information Window

This section describes the Maintenance Information Window, which can be used to monitor the status of Counter Units and Positioning Units. The Monitor Device Window can be used to check the same Unit status information, but the examples in this section use the Maintenance Information Window.

7-3-1 Checking Maintenance Information

There are two ways to check maintenance information. One way is to rightclick in the Main Window of the Setting Tool and select *Maintenance Information*. The other way is to double-click the Unit in the Maintenance Mode Window, click the **I/O Module** Tab, select the desired Unit, and click the **View** Button to display the Maintenance Information Window of the Counter Unit or Positioning Unit.

7-4 GRT1-CT1(-1) Counter Units

This section describes the GRT1-CT1 and GRT1-CT1-1 Counter Units.

7-4-1 Specifications

General Specifications

ltem	Specification
Unit power supply voltage	24 V DC (20.4 to 26.4 V DC)
I/O power supply voltage	24 V DC (20.4 to 26.4 V DC)
Noise immunity	Conforms to IEC 61000-4-4, 2.0 kV (power lines)
Vibration resistance	10 to 60 Hz, 0.7-mm double amplitude; 60 to 150 Hz, 50 m/s ²
Shock resistance	150 m/s ²
Dielectric strength	500 V AC (between isolated circuits)
Insulation resistance	20 MΩ minimum (between isolated circuits)
Ambient operating temperature	-10 to 55°C (with no icing or condensation)
Ambient operating humidity	25% to 85%
Operating environment	No corrosive gases
Ambient storage temperature	-25 to 65°C (with no icing or condensation)
Mounting	35-mm DIN Track mounting

Performance Specifications

Item	Specification
Input points	2 counter inputs (A and B) and 1 settable input (Z input or digital input)
Output points	1 digital output (settable)
Counter resolution	32-bit
Maximum counter input fre- quency	60 kHz max. depending on the counter mode. Refer to I/O Signal Specifications on page 229 for details.
Overall response time	1 ms max. (See note.)
Isolation method	Photocoupler isolation between communications lines and inputs/output lines.
	No isolation between inputs signal lines and output signal lines.
I/O connection method	Screwless Terminal block

Note The response time is the time between the moment the A, B, Z, or IN input turns ON or OFF and the moment the digital output is updated to the new state. The specified response time may not be achieved during monitoring or maintenance.

I/O Signal Specifications

The encoder A and B inputs are phase differential signals for counting. The encoder Z input is a zero marker each revolution.

Inputs

Encoder A and B Inputs

ltem	Specification	
Model	GRT1-CT1	GRT1-CT1-1
Input type	NPN	PNP
Number of inputs	2 (A and B encoder inputs)	
ON voltage	18.6 V min. (between input terminal and V)	18.6 V min. (between input terminal and G)
ON current	3.0 mA min.	
OFF voltage	4.0 V max. (between input terminal and V)	4.0 V max. (between input terminal and G)

ltem	Specification	
OFF current	1.0 mA max.	
Maximum input signal	60 kHz for pulse/direction counter mode	
frequency	60 kHz for up/down counter mode	
	30 kHz for phase differential counter mode (×1, ×2, or ×4)	

Encoder Z Input or Digital Input (IN)

ltem	Specification		
Model	GRT1-CT1	GRT1-CT1-1	
Input type	NPN	PNP	
Number of inputs	1		
ON voltage	15.0 V min. (between input terminal and V)	15.0 V min. (between input terminal and G)	
ON current	3.0 mA min.		
OFF voltage	5.0 V max. (between input terminal and V)	5.0 V max. (between input terminal and G)	
OFF current	1.0 mA max.		
ON response time	1 ms max. (See note)		
OFF response time	1 ms max. (See note)		

Note The response time is the time between the moment the A, B, or Z/IN input turns ON or OFF and the moment the digital output is updated to the new state. The specified response time may not be achieved during monitoring or maintenance.

Digital Output (OUT)

Item	Specification		
Model	GRT1-CT1	GRT1-CT1-1	
Output type	NPN	PNP	
Number of outputs	1		
Total output current	500 mA max.		
Residual voltage	1.2 V max. (between output terminal and G)	1.2 V max. (between output terminal and V)	
Leakage current	0.1 mA max.	0.1 mA max.	
ON response time	1 ms max. (See note)		
OFF response time	1 ms max. (See note)		

Note The response time is the time between the moment the A, B, Z, or IN input turns ON or OFF and the moment the digital output is updated to the new state. The specified response time may not be achieved during monitoring or maintenance.

7-4-2 Hardware

Names and Functions of Parts

LED Indicators

The indicators on the front of the Counter Units are shown below.

TS Indicators

The green and red TS indicators show the status of the Slice I/O Unit itself. Refer to 2-1-3 LED Indicators for details.

I/O Indicators

The I/O indicators show the status of the counter inputs and digital I/O.

Name	Color	Indicator status		I/O status
A	Yellow		Lit	Input A is ON.
			Not lit	Input A is OFF.
В	Yellow		Lit	Input B is ON.
			Not lit	Input B is OFF.
Z/I	Yellow		Lit	Input Z or digital input is ON.
			Not lit	Input Z or digital input is OFF.
0	Yellow		Lit	The digital output is ON.
			Not lit	The digital output is OFF.
Hardware Settings

There are no hardware settings required for the Counter Units.

7-4-3 I/O Data Details

Output Data

The following table describes the data output from the Output Area allocated in the Master to the Counter Unit. This data is used to set and control the Counter Unit.

"n" is the first word in the Output Area allocated to the Counter Unit in the Master.

Words	Bits	Definition	
n and	00 to 15	Set Value	
n+1		The Set Value is set between –2,147,483,648 and 2,147,483,647.	
		The Set Value will be transferred to the internal register specified by the Register Selection Bits (bits 00 to 02 of word $n+2$) when the Write Command Bit (bit 03 of word $n+2$) is turned ON.	
n+2 00 to 02		Register Selection Bits	
		These bits determine for which internal register the Set Value (words n and n+1) will be used when the Write Command Bit or Counter Data Display Command Bit (bit 03 or bit 04 of word n+2) is turned ON.	
		Bit: 02 01 00 0 0 0 = Present Counter Value	
		0 0 1 = Present Frequency (frequency of A input signal in Hz) 0 1 0 = Capture Value Register 0 1 1 = Preset Value Register	
		1 0 0 = Range Value Register 0 (LL)	
		1 0 1 = Range Value Register 1 (UL)	
		$\begin{array}{rrrr} 1 & 1 & 0 & = \text{Not supported.} \\ 1 & 1 & 1 & = \text{Not supported.} \end{array}$	
	03	Write Command Bit (See note.)	
		Turn ON this bit to write the Set Value (words n and n+1) to the internal register specified by the Register Selection Bits (bits 00 to 02 of word n+2).	
		If the selected register is 000, 001, 010, 110, or 111, then nothing happens.	
Turn ON this bit to change ister specified by the Regis		Counter Data Display Command Bit (See note.)	
		Turn ON this bit to change the register displayed in the Counter Data (words m and m+1) to the reg- ister specified by the Register Selection Bits (bits 00 to 02 of word n+2). The specified register will not change regardless of write actions.	
	05	Digital Input Enable Bit	
		This bit enables and disables the digital input.	
		OFF: The function assigned to the digital input is disabled. ON: The function assigned to the digital input is enabled.	
	06 and	Digital Input Counter Reset Mode Bits	
	07	These bits set the counter reset mode for the digital input.	
		Bit: 07 06	
		 0 0 = Not supported. 0 1 = The counter value is reset to zero on first rising edge of the digital input. 1 0 = The counter value is reset to zero on every rising edge of the digital input. 1 1 = Not supported. 	
	08	Gate Control Bit	
		This bit enables and disables the counter.	
		OFF: Counting is enabled.	
		ON: Counting is disabled (i.e., no pulses are counted), and the Present Counter Value will not change in response to encoder inputs.	
		The Present Counter Value can be changed using a reset or preset command even when counting is disabled.	
	09	Capture Command Bit (See note.)	
		Turn ON this bit to store the Present Counter Value in the Capture Value Register.	
	10	Preset Command Bit (See note.)	
		Turn this bit ON (at time of starting) to set the Preset Value Register to the Present Counter Value.	

GRT1-CT1(-1) Counter Units

Words	Bits	Definition	
n+2	11	Reset Command Bit (See note.)	
(contin-		Turn ON this bit to reset the Present Counter Value to 0.	
ued)	12 and	Output Control Bits	
	13	These bits control the digital output (OUT).	
Bit: 13 12		Bit: 13 12	
		0 0 = Digital output controlled by range (LL and UL).	
		0 1 = Digital output turned OFF.	
		 1 0 = Digital output turned ON. 1 = Digital output turned ON. 	
	14 and 15	Reserved.	

Note Each command is executed only once when the command bit is turned ON. Command bits are not reset automatically and must be reset by the user. Make sure to reset the command bit after execution of the command has been completed (i.e., after the corresponding Completed Flag has turned ON in word m+2). Also, make sure that all command bits are OFF when the Unit is started, including starting a new Unit after Unit replacement.

Input Data The following table describes the data input from Counter Unit to the Input Area allocated in the Master. This data is used to monitor counter data and Counter Unit operating status.

"m" is the first word in the Input Area allocated to the Counter Unit in the Master.

Word	Bits	Definition		
m and	00 to 15	Counter Data		
m+1		The data from the Counter Unit specified by the Register Selection Bits (bits 00 to 02 of word n+2) when the Counter Data Display Command Bit (bit 04 of n+2) was last turned ON is displayed here. Check the Display Register Indication Bits (bits 00 to 02 of word m+2) to verify what data is currently displayed here.		
m+2	00 to 02	Display Register Indication Bits		
		These bits indicate which register is displayed in words m and m+1.		
		Bit: 02 01 00		
		0 0 0 = Present Counter Value 0 0 1 = Present Frequency (frequency of A input signal in Hz)		
		0 1 0 = Capture Value Register		
		0 1 1 = Preset Value Register		
		1 0 0 = Range Value Register (LL) 1 0 1 = Range Value Register (UL)		
		1 1 0 = Not supported		
		1 1 1 = Not supported		
		"Not supported" means that no register is assigned to that bit combination.		
	03	Write Command Completed Flag		
		This flag turns ON when the Write Command has been completed (triggered by the Write Comman Bit, bit 03 of word n+2). This flag will turn OFF when the Write Command Bit is reset.		
	04	Multiple Commands Warning Flag		
		This flag will turn ON if more than one of the following bits was turned ON at the same time: Word n+2, bits 03, 09, 10, and 11.		
	The commands will be executed but the results may be unexpected.			
05 Reserved.		Reserved.		
	06	Underflow Flag		
		This flag will turn ON if the count value underflows. Counting will stop with the count value at the		
		lower limit. The lower limit is -2,147,483,648. To restart counting, preset or reset the counter value. This flag will turn OFF when counting restarts.		

Word	Bits	Definition
m+2	07	Overflow Flag
(contin- ued)		This flag will turn ON if the count value overflows. Counting will stop with the count value at the upper limit. The upper limit is 2,147,483,647. To restart counting, preset or reset the counter value. This flag will turn OFF when counting restarts.
	08	Counter Operation Flag
		This flag shows the status of counter operation. The counter operation can be controlled by the Gate Control Bit (bit 08 of word n+2).
		OFF: Stopped. ON: In progress.
	09	Capture Command Completed Flag
		This flag turns ON when the Capture Command has been completed (triggered by the Capture Command Bit, bit 09 of word n+2). This flag will turn OFF when the Capture Command Bit is reset.
	10	Preset Command Completed Flag
		This flag turns ON when the Preset Command has been completed (triggered by the Preset Command Bit, bit 10 of word n+2). This flag will turn OFF when the Preset Command Bit is reset.
11		Reset Command Completed Flag
		This flag turns ON when the Reset Command has been completed (triggered by the Reset Command Bit, bit 11 of word n+2). This flag will turn OFF when the Reset Command Bit is reset.
12		Digital Input (IN) Status Flag
		This flag shows the present status of the digital input.
		OFF: Low (OFF) ON: High (ON)
	13	Reserved.
	14	Digital Output Status Flag
		This flag shows the present status of the digital output.
		OFF: Low (OFF) ON: High (ON)
	15	Reserved.

7-4-4 Functions and Settings

The following functions are the same as those for the Digital I/O Units. Refer to the sections given below for details.

Function	Reference
I/O Power Supply Monitor	4-4-1 I/O Power Supply Monitor
Contact Operation Counter	4-4-4 Contact Operation Counter
Total ON Monitor Time	4-4-5 Total ON Time Monitor

Setting Special Counter Unit Functions

Counter Unit functions are set using the Edit Unit Parameters Window. The procedure for accessing the Edit Unit Parameters Windows depends on the Support Software that is being used. The procedure for DeviceNet Configurator (version 2.43 or higher) is given below as an example.

- 1,2,3...
 - (1) Open the Network Configuration Window in the DeviceNet Configurator.
 - (2) Double-click the desired Slice I/O Terminal's icon or right-click the icon and select *Parameters - Edit* to display the Edit Device Parameters Window shown below.

Slot	Product Name
01	GRT1-CT1
02	GRT1-CT1-1
03	GRT1-CP1-L

Functions Shared by All Units

Refer to the following sections for the items on the General Tab Page.

Function	Reference
Comment	2-3-5 Unit Comments
Unit Conduction Time	2-3-4 Unit Conduction Time Monitor
Last Maintenance Date	2-3-8 Last Maintenance Date

■ Default Settings

The Default Setting Button on the General Tab Page will download the default settings for all parameters on all tabs to the Counter Unit.

Setting Digital Output Functions

A Counter Unit supports one digital output. Use the following procedure to set functionality. The digital output can also be controlled according to the counter value in comparison to a user-set range. Refer to *Range 0 Tab Page* on page 244 for details.

1,2,3... 1. Click the **OUT** Tab in the Edit Unit Parameters Window to display the *OUT* Tab Page shown below.

No.	1/0 Comment	Detection	Value	
00		Time	0	

2. Select the digital output (No. 00) and click the **Edit** Button. The Edit Terminal Dialog Box will be displayed.

Edit Terminal	×
I/O Comment :	
Detection Mode	
Time	🔿 Count
Value : 0	(0 - 4294967295 Times) (0 - 4294967295 Seconds)
OK	Cancel

3. Set the items in the dialog box as shown in the following table.

Item	Description
I/O Comment	Enter a comment for the digital output.
Detection Mode	Specify whether to keep track of the total ON time (unit: s) or number of contact operations (unit: operations) for the main- tenance counter of the digital output.
Value	Enter the set value for the detection mode.
	The value can be set to between 0 and 4,294,967,295 oper- ations for the number of contact operations and to between 0 and 4,294,967,295 seconds for the total ON time.

The above settings are stored in non-volatile memory. If a setting is changed, the Counter Unit must be reset before the new setting will be valid.

Setting Digital Input Functions

A Counter Unit supports one digital input. Use the following procedure to set functionality. To set the functionality of the digital input rising and falling edges, refer to the *General Tab Page* on page 240.

1,2,3... 1. Click the **IN** Tab in the Edit Unit Parameters Window to display the *IN* Tab Page shown below.

eneral	OUT IN Counte	f]		
10	V Delay : 0	Y		
OF	F Delay : 0	w.

3. Set the items in the dialog box as shown in the following table.

Item	Description			
I/O Comment	Enter a comment for the digital input.			
Detection Mode	Specify whether to keep track of the total ON time (unit: s) or number of contact operations (unit: operations) for the mainte- nance counter of the digital input.			
Value	Enter the set value for the detection mode.			
	The value can be set to between 0 and 4,294,967,295 opera- tions for the number of contact operations and to between 0 and 4,294,967,295 seconds for the total ON time.			

The above settings are stored in non-volatile memory. If a setting is changed, the Counter Unit must be reset before the new setting will be valid.

Setting Counter Functions

A Counter Unit supports one counter input.

Click the **Counter** Tab in the Edit Unit Parameters Window to display the *Counter* Tab Page shown below.

unction Choice		
General Preset		
Parameter Name	Value	
0000 Configuration tag	0	
0001 Counter Input Mode	Phase differential x1	
0002 Action on Input Rising Edge	No Action	
0003 Action on Input Falling Edge	No Action	-
Help Help String	Default : 0 Min : 0 Max : 255	
Default Setting		

The Counter Tab Page contains up to three tab pages used to set various counter functionality. The Range 0 Tab Page appears only when the *Range 0* check box is selected.

HelpHelp is provided at the bottom of each tab page inside the Counter Tab Page,
along with the default setting and setting limits.

General Tab Page

The General Tab Page is used to set counter operating parameters, as described below.

These settings are stored in non-volatile memory. If a setting is changed, the Counter Unit must be reset before the new setting will be valid.

Configuration Tag

The configuration tag indicates the version of all the present counter parameter settings. The configuration tag can be used to manage the parameter settings as a group. The user can set the configuration tag to any value between 0 and 255. The configuration tag is downloaded with the rest of the parameter settings to the Counter Unit and uploaded with the rest of the parameter settings from the Counter Unit.

Counter Input Mode

Select one of the following counter input modes.

Counter input mode	Description
Phase differential ×1	Phase-shifted pulses are received on inputs A and B.
	• When the pulses on input A lead the pulses on input B, the counter value is incremented on the falling edge of input A.
	• When the pulses on input B lead the pulses on input A, the counter value is decremented on the rising edge of input A.
Phase differential ×2	Phase-shifted pulses are received on inputs A and B.
	 When the pulses on input A lead the pulses on input B, the counter value is incremented.
	 When the pulses on input B lead the pulses on input A, the counter value is decremented.
	• The counter value is changed on the rising and falling edges of input A.
Phase differential ×4	Phase-shifted pulses are received on inputs A and B.
	 When the pulses on input A lead the pulses on input B, the counter value is incremented.
	 When the pulses on input B lead the pulses on input A, the counter value is decremented.
	 The counter value is changed on the rising and falling edge of both input A and input B.
Pulse and direction	Input A pulses are counted and input B determines the direc- tion of counting.
	While input B is OFF, the counter value is incremented.
	 While input B is ON, the counter value is decremented.
	• The counter value is changed on the falling edge of input A.
Up/down Counter	• The counter value is incremented when pulses are received on input A.
	• The counter value is decremented when pulses are received on input B.
	 The counter value is changed on the falling edge of input A or B.

Phase Differential Counting

The following figure illustrates the operation of phase differential counting.

Input A				<u>, </u>			<u> </u>	<u> </u>		/			<u> </u>
Input B	,				,								
×1	0 1		2		3		2	2			1		2
×2	0 1	2 3	4	5	6	5	4	3	2		1	2	3 4
×4	0 1 2 3	456	78	91011	12	11109	87	65	43	2	1	234	5678

Action	Description
No Action	No action is executed.
Capture	The Present Counter Value is stored in the Capture Value Register. The captured value can be retrieved at any time using the Counter Data Display Command Bit (bit 04 of word n+2).
Reset The counter value is reset to 0.	
Preset	The counter value is set to the preset value.

Action upon Bus Error

Select the action to be executed when a bus error occurs.

Action	Description
Outputs are Cleared	The output status will be cleared until the bus error is removed, but the counter value will still be updated according to the encoder inputs.
	The output status will continue to be updated and the counter value will still be updated according to the encoder inputs.

Action upon Bus Idle

Select the action to be executed when the bus goes idle (i.e., when an error occurs in host communications, such as a DeviceNet or PROFIBUS error).

Action	Description
Outputs are Cleared	The output status will be cleared until the bus idle is removed, but the counter value will still be updated according to the encoder inputs.
	The output status will continue to be updated and the counter value will still be updated according to the encoder inputs.

Default Settings

Press the **Default Setting** Button on the *General* Tab Page to set the following default values.

Setting	Default value
Counter Input Mode	Phase differential ×1
Action on Input Rising Edge	No Action
Action on Input Falling Edge	No Action

Setting	Default value
Action upon Bus Error	Outputs are cleared.
Action upon Bus Idle	Outputs are cleared.
Configuration tag	(Not affected.)

Preset Tab Page

The Preset Tab Page is used to set the counter to a preset value. The counter can be set to the preset value using the *Action on Input Rising Edge* or *Action on Input Falling Edge* setting for the digital input or using the Preset Command Bit (bit 10 of word n+2).

Click the **Preset** Tab in the Edit Unit Parameters Window. The *Preset* Tab Page will be displayed.

eneral OUT IN Counter

Parameter Name	Value
0000 Preset value	0
Help	
Help String	Default : 0 Min : -2147483648 Max : 2147483647
Default Setting	

Preset Value

Set the *Preset value* Field to the desired preset value. The set value will be stored in the Preset Value Register.

The following figure shows how the preset value works. In this example, a fixed frequency is input from the encoder to the counter and the preset value is set to 1000.

The preset value can be set to between -2,147,483,648 (8000 0000 hex) and 2,147,483,647 (7FFF FFFF hex).

This setting is stored in non-volatile memory. If the setting is changed, the new value is effective immediately.

■ <u>Default Settings</u>

Press the **Default Setting** Button on the *Preset* Tab Page to set the following default value.

Setting	Default value
Preset value	0

Range 0 Tab PageThe tab page to set a comparison range is displayed only when the range is
enabled. Click the Range 0 Button on the Counter Tab Page to enable using
the range and display the Range 0 Tab Page. The digital output will not be
controlled by the comparison function unless a range is set.

Note The digital output will be controlled by the Range only when the Output Control Bits (bits 12 and 13 of word n+2) are OFF.

The Range 0 Tab Page is used to set a comparison range for the counter value. The range has a lower limit (LL) and an upper limit (UL). The digital output can be controlled according to the counter value in respect to this range.

Click the **Range 0** Tab in the Edit Unit Parameters Window. The *Range 0* Tab Page will be displayed.

Init Parameters - #02 GRT1-CT1-1 neral OUT IN Counter	
unction Choice

Help String	Default : 2147483647 Min : -2147483648 Max : 2147483647
Default Setting	
	OK Can

Operation

The output will be controlled according to the relationship between the counter value and the range settings as follows:

- If UL > LL, the digital output will be ON when LL ≤ Counter value ≤ UL, and will be OFF otherwise.
- If UL < LL, the digital output will be OFF when UL ≤ Counter value ≤ LL, and will be ON otherwise.
- If UL = LL, the digital output will be ON when LL = Counter value = UL, and will be OFF otherwise.

The following figures illustrate the first two cases.

Case 2: UL < LL

Setting a Comparison Range

Enter the desired values in the *Lower limit* and *Upper limit* Fields. The values can be between -2,147,483,648 (8000 0000 hex) and 2,147,483,647 (7FFF FFFF hex).

These settings are stored in non-volatile memory. If a setting is changed, the new value is effective immediately.

The range will be disabled if the range values are set to the minimum and maximum values.

Default Settings

Press the **Default Setting** Button on the *Range 0* Tab Page to set the following default values.

Setting	Default value
Range 0	Disabled. (Option not selected.)

7-5 GRT1-CP1-L Positioning Unit

This section describes the GRT1-CP1-L Positioning Unit.

7-5-1 Specifications

General Specifications

Item	Specification	
Unit power supply voltage	24 V DC (20.4 to 26.4 V DC)	
I/O power supply voltage	24 V DC (20.4 to 26.4 V DC)	
Noise immunity	Conforms to IEC 61000-4-4, 2.0 kV (power lines)	
Vibration resistance	10 to 60 Hz, 0.7-mm double amplitude; 60 to 150 Hz, 50 m/s ²	
Shock resistance	150 m/s ²	
Dielectric strength	500 V AC (between isolated circuits)	
Insulation resistance	20 MΩ minimum (between isolated circuits)	
Ambient operating temperature	-10 to 55°C (with no icing or condensation)	
Ambient operating humidity	25% to 85%	
Operating environment	No corrosive gases	
Ambient storage temperature	-25 to 65°C (with no icing or condensation)	
Mounting	35-mm DIN Track mounting	

Performance Specifications

Item	Specifications	
Input points	3 counter inputs (A, B, and Z) and 1 digital input	
Output points	2 digital outputs (settable)	
Signal levels for A, B, and Z counter	24 V or line driver interface	
inputs	Set using a DIP switch. Refer to Hardware Settings on page 249.	
Counter resolution	32-bit	
Maximum pulse input frequency	100 kHz max. depending on the counter mode. Refer to I/O Signal Specifica- tions on page 246 for details.	
Overall response time	1 ms max. (See note.)	
Isolation method	Photocoupler isolation between communications lines and inputs/output lines.	
	24-V interface: No isolation between input A, input B, input Z, digital input (IN), and digital outputs (OUT0 and OUT1).	
	Line-driver interface: Isolation between inputs A, B, and Z. No isolation between digital input (IN) and digital outputs (OUT0 and OUT1).	
I/O connection method	Screwless Terminal block	

Note The response time is the time between the moment the A, B, Z, or IN input turns ON or OFF and the moment the digital output is updated to the new state. The specified response time may not be achieved during monitoring or maintenance.

I/O Signal Specifications

The encoder A and B inputs are phase differential signals for counting. The encoder input Z is a zero marker each revolution. The A, B and Z inputs may be either 24 V or line driver levels according to the DIP switch setting. Refer to *Hardware Settings* on page 249.

Encoder A, B, and Z Inputs

24 V Inputs

ltem	Specification	
Input type	PNP	
Number of inputs	3 (encoder inputs A, B, and Z)	
ON voltage	18.6 V DC min. (between input terminal and G terminal)	
ON current	3.0 mA min.	
OFF voltage	4.0 V DC max. (between input terminal and G terminal)	
OFF current	1.0 mA max.	
Maximum input signal	60 kHz for pulse/direction counter mode	
frequency	60 kHz for up/down counter mode	
	30 kHz for phase differential counter mode (\times 1, \times 2, or \times 4)	

Line Driver Inputs

ltem	Specification	
ON voltage	2.0 V DC min. (RS-422 line driver-compatible level)	
OFF voltage	0.8 V DC max. (RS-422 line driver-compatible level)	
Number of inputs	3 (encoder inputs A, B, and Z)	
Maximum input signal	100 kHz for pulse/direction counter mode	
frequency	100 kHz for up/down counter mode	
	50 kHz for phase differential counter mode (\times 1, \times 2, or \times 4)	

Digital Input (IN)

ltem	Specification	
Input type	PNP	
Number of inputs	1	
ON voltage	15.0 V DC min. (between input terminal and G terminal)	
ON current	3.0 mA min.	
OFF voltage	5.0 V DC max. (between input terminal and G terminal)	
OFF current	1.0 mA max.	
ON response time	1 ms max. (See note.)	
OFF response time	1 ms max. (See note.)	

Note

The response time is the time between the moment the A, B, Z, or IN input turns ON or OFF and the moment the digital output is updated to the new state. The specified response time may not be achieved during monitoring or maintenance.

Digital Outputs (OUT0 and OUT1)

Item	Specification	
Output type	PNP	
Number of outputs	2	
Total output current	500mA max.	
Residual voltage	1.2 V max.	
Leakage current	0.1 mA max.	
ON response time	1 ms max. (See note.)	
OFF response time	1 ms max. (See note.)	
Output short-circuit protection	None	
Off-wire detection	None	

Note The response time is the time between the moment the A, B, Z or IN input turns ON or OFF and the moment the digital output is updated to the new state. The specified response time may not be achieved during monitoring or maintenance.

7-5-2 Hardware

Names and Functions of Parts

LED Indicators

The indicators on the front of the Positioning Unit are shown below.

TS Indicators

The green and red TS indicators show the status of the Slice I/O Unit itself. Refer to 2-1-3 LED Indicators for details.

I/O Indicators

The I/O indicators show the status of the counter inputs and digital I/O.

Inputs A and B from the rotary encoder share one indicator. Input Z from the rotary encoder and the digital input (IN) also share one indicator. The shared indicators are controlled via an exclusive-OR of the two inputs, e.g., the indicator is OFF when both inputs are ON or both inputs are OFF.

The two digital outputs each have a separate indicator. The I/O Indicators are described in the following table.

Name	Color	Indicator status	I/O status
А, В	Yellow	Lit	Either input A or input B is ON and the other input is OFF.
		Not lit	Inputs A and B are either both ON or both OFF.

Name	Color	Indicator status	I/O status
Ζ, Ι	Yellow	Lit	Either input Z or the digital input is ON and the other input is OFF.
		Not lit	Input Z and the digital input are either both ON or both OFF.
00	Yellow	Lit	Digital output 0 is ON.
		Not lit	Digital output 0 is OFF.
01	Yellow	Lit	Digital output 1 is ON.
		Not lit	Digital output 1 is OFF.

Hardware Settings

The DIP switch on the board inside the Positioning Unit must be set to select the required interface. Either a 24-V or line driver interface can be used.

DIP switch setting	Interface
All pins ON	24 V
All pins OFF	Line driver

The DIP switch is accessed as shown below. It has four pins.

Set the interface on the DIP switch inside the Positioning Unit. Use a flat-blade screwdriver to similar tool to make setting the pins easier.

Internal Circuits

GRT1-CP1-L Set to 24 V Mode

GRT1-CP1-L Set to Line Driver Mode

Wiring

Connect the terminals of the Positioning Unit according to the following diagrams. The connections depend on the counter input signal interface that is set.

24-V rotary encoder (all DIP switch pins ON)

A	N.C.
В	N.C.
Z	N.C.
IN	OUT0
V	OUT1
G	G

Line driver rotary encoder (all DIP switch pins OFF)

A+	А—	
B+	B–	
Z+	Z–	
IN	OUT0	
V	OUT1	
G	G	

Dimensions (Unit: mm)

7-5-3 I/O Data Details

Output Data

The following table describes the data output from the Output Area allocated in the Master to the Positioning Unit. This data is used to set and control the Positioning Unit.

"n" is the first word in the Output Area allocated to the Counter Unit in the Master.

Word	Bits	Definition	
n and	00 to 15	Set Value	
n+1		The Set Value is set between -2,147,483,648 and 2,147,483,647.	
		The Set Value will be transferred to the internal register specified by the Register Selection Bits (bits 00 to 02 of word $n+2$) when the Write Command Bit (bit 03 of word $n+2$) is turned ON.	
n+2	00 to 02	Register Selection Bits	
		These bits determine for which internal register the Set Value (words n and n+1) will be used when the Write Command Bit or Counter Data Display Command Bit (bit 03 or bit 04 of word n+2) is turned ON.	
		Bit: 02 01 00	
		0 0 = Present Counter Value	
		0 0 1 = Present Frequency (frequency of A input signal in Hz) 0 1 0 = Capture Value Register	
		0 1 1 = Preset Value Register	
		1 0 0 = Range Value Register 0 (LL0)	
		1 0 1 = Range Value Register 1 (UL0)	
		1 1 0 = Range Value Register 0 (LL1)	
		1 1 1 = Range Value Register 1 (UL1)	
	03	Write Command Bit (See note.)	
		Turn ON this bit to write the Set Value (words n and n+1) to the internal register specified by the Register Selection Bits (bits 00 to 02 of word n+2).	
		If the selected register is 000, 001, or 010, then nothing happens.	

Section 7-5

Word	Bits	Definition
n+2	04	Counter Data Display Command Bit (See note.)
(contin- ued)		Turn ON this bit to change the register displayed in the Counter Data (words m and m+1) to the register specified by the Register Selection Bits (bits 00 to 02 of word n+2). The specified register will not change regardless of write actions.
	05	Digital Input Enable Bit
		This bit enables and disables the digital input.
		OFF: The function assigned to the digital input is disabled. ON: The function assigned to the digital input is enabled.
	06 and	Z Input Counter Reset Mode Bits
	07	These bits set the counter reset mode for the Z input.
		 Bit: 07 06 0 0 = Z input is ignored 0 1 = The counter value is reset to zero on first rising edge of the Z input. 1 0 = The counter value is reset to zero on every rising edge of the Z input. 1 1 = The counter value is reset to zero on every rising edge of the Z input if the digital input (IN) is ON.
	08	Gate Control Bit
		This bit enables and disables the counter.
		OFF: Counting is enabled.
		ON: Counting is disabled (i.e., no pulses are counted), and the Present Counter Value will not change in response to encoder inputs.
		The Present Counter Value can be changed using a reset or preset command even when counting is disabled.
	09	Capture Command Bit (See note.)
		Turn ON this bit to store the Present Counter Value in the Capture Value Register.
	10	Preset Command Bit (See note.)
		Turn ON this bit to set the Preset Value Register to the Present Counter Value.
	11	Reset Command Bit (See note.)
		Turn ON this bit to reset the Present Counter Value to 0.
	12 and	Output 0 Control Bits
	13	These bits control digital output 0 (OUT0).
		Bit: 13 12 0 0 = Digital output 0 controlled by range 0 (LL0 and UL0).
		0 1 = Digital output 0 turned OFF.
		 1 0 = Digital output 0 turned ON. 1 1 = Digital output 0 turned ON.
	14 and	Output 1 Control Bits
	15	These bits control digital output 1 (OUT1).
		Bit: 15 14
		0 0 = Digital output 1 controlled by range 1 (LL1 and UL1).
		0 1 = Digital output 1 turned OFF.
		 1 0 = Digital output 1 turned ON. 1 1 = Digital output 1 turned ON.

Note Each command is executed only once when the command bit is turned ON. Command bits are not reset automatically and must be reset by the user. Make sure to reset the command bit after execution of the command has been completed (i.e., after the corresponding Completed Flag has turned ON in word m+2). Also, make sure that all command bits are OFF when the Unit is started, including when starting a new Unit after Unit replacement.

Input Data

The following table describes the data input from Positioning Unit to the Input Area allocated in the Master. This data is used to monitor counter data and Positioning Unit operating status.

"m" is the first word in the Input Area allocated to the Counter Unit in the Master.

Words	Bits	Definition
m and	00 to 15	Counter Data
m+1		The data from the Counter Unit specified by the Register Selection Bits (bits 00 to 02 of word n+2) when the Counter Data Display Command Bit (bit 04 of n+2) was last turned ON is displayed here. Check the Display Register Indication Bits (bits 00 to 02 of word m+2) to verify what data is currently displayed here.
m+2	00 to 02	Display Register Indication Bits
		These bits indicate which register is displayed in words m and m+1.
		Bit: 02 01 00 0 0 0 = Present Counter Value 0 0 1 = Present Frequency (frequency of A input signal in Hz) 0 1 0 = Capture Value Register 0 1 1 = Preset Value Register 1 0 0 = Range Value Register 0 (LL0) 1 0 1 = Range Value Register 0 (UL0) 1 1 0 = Range Value Register 1 (LL1) 1 1 1 = Range Value Register 1 (UL1)
	03	Write Command Completed Flag
		This flag turns ON when the Write Command has been completed (triggered by the Write Command Bit, bit 03 of word n+2). This flag will turn OFF when the Write Command Bit is reset.
	04	Multiple Commands Warning Flag
Word n+2, bits 03, 09, 10, and 11.The commands will be executed but the results may be unexpected.05Reserved.		This flag will turn ON if more than one of the following bits was turned ON at the same time: Word n+2, bits 03, 09, 10, and 11.
		The commands will be executed but the results may be unexpected.
	06	Underflow Flag This flag will turn ON if the count value underflows. Counting will stop with the count value at the lower limit. The lower limit is –2,147,483,648. To restart counting, preset or reset the counter value. This flag will turn OFF when counting restarts.
	07	Overflow Flag
		This flag will turn ON if the count value overflows. Counting will stop with the count value at the upper limit. The upper limit is 2,147,483,647. To restart counting, preset or reset the counter value. This flag will turn OFF when counting restarts.
	08	Counter Operation Flag
		This flag shows the status of counter operation. The counter operation can be controlled by the Gate Control Bit (bit 08 of word n+2).
		OFF: Stopped. ON: In progress.
	09	Capture Command Completed Flag
		This flag turns ON when the Capture Command has been completed (triggered by the Capture Command Bit, bit 09 of word n+2). This flag will turn OFF when the Capture Command Bit is reset.
	10	Preset Command Completed Flag
		This flag turns ON when the Preset Command has been completed (triggered by the Preset Command Bit, bit 10 of word n+2). This flag will turn OFF when the Preset Command Bit is reset.
	11	Reset Command Completed Flag
		This flag turns ON when the Reset Command has been completed (triggered by the Reset Command Bit, bit 11 of word n+2). This flag will turn OFF when the Reset Command Bit is reset.

Words	Bits	Definition	
m+2	12	Digital Input (IN) Status Flag	
(contin-		This flag shows the present status of the digital input.	
ued)		OFF: Low (OFF) ON: High (ON)	
	13	Encoder Input Z Status Flag	
		This flag shows the present status of the encoder Z input.	
		OFF: Low (OFF) ON: High (ON)	
	14	Digital Output 0 (OUT0) Status Flag	
		This flag shows the present status of digital output 0.	
		OFF: Low (OFF) ON: High (ON)	
	15	Digital Output 1 (OUT1) Status Flag	
		This flag shows the present status of digital output 1.	
		OFF: Low (OFF) ON: High (ON)	

7-5-4 Functions and Settings

The following functions are the same as those for the Digital I/O Units. Refer to the sections given below for details.

Function	Reference
I/O Power Supply Monitor	4-4-1 I/O Power Supply Monitor
Contact Operation Counter	4-4-4 Contact Operation Counter
Total ON Monitor Time	4-4-5 Total ON Time Monitor

Setting Special Positioning Unit Functions

Positioning Unit functions are set using the Edit Unit Parameters Window. The procedure for accessing the Edit Unit Parameters Windows depends on the Support Software that is being used. The procedure for DeviceNet Configurator (version 2.43 or higher) is given below as an example.

- *1,2,3...* (1) Open the Network Configuration Window in the DeviceNet Configurator.
 - (2) Double-click the desired Slice I/O Terminal's icon or right-click the icon and select *Parameters - Edit* to display the Edit Device Parameters Window shown below.

Slot	Product Name	
01	GRT1-CT1	
02	GRT1-CT1-1	
03	GRT1-CP1-L	
04		
05	1900 C	
06		
07		
08

Functions Shared by All Units

Refer to the following sections for the items on the General Tab Page.

Function	Reference	
Comment	2-3-5 Unit Comments	
Unit Conduction Time	2-3-4 Unit Conduction Time Monitor	
Last Maintenance Date	2-3-8 Last Maintenance Date	

Default Settings

The Default Setting Button on the General Tab Page will download the default settings for all parameters on all tabs to the Positioning Unit. The values on the tab pages will not be updated.

Setting Digital Output Functions A Positioning Unit supports two digital outputs. Use the following procedure to set functionality. The digital outputs can also be controlled according to the counter value in comparison to user-set ranges. Refer to *Range 0 and Range 1 Tab Pages* on page 263 for details.

1. Click the OUT Tab in the Edit Unit Parameters Window to display the OUT Tab Page shown below.

No.	1/0 Comment	Detection	Value	
00		Time	0	
01		Time	0	

2. Select the digital output (No. 00 or 01) and click the **Edit** Button. The Edit Terminal Dialog Box will be displayed.

Edit Terminal	×
I/O Comment :	
Detection Mode	
• Time	🔿 Count
Value : 0) (0 - 4294967295 Times) (0 - 4294967295 Seconds)
ОК	Cancel

3. Set the items in the dialog box as shown in the following table.

Item	Description
I/O Comment	Enter a comment for the digital output.
Detection Mode	Specify whether to keep track of the total ON time (unit: s) or number of contact operations (unit: operations) for the main- tenance counter of the digital output.
Value	Enter the set value for the detection mode.
	The value can be set to between 0 and 4,294,967,295 oper- ations for the number of contact operations and to between 0 and 4,294,967,295 seconds for the total ON time.

The above settings are stored in non-volatile memory. If a setting is changed, the Positioning Unit must be reset before the new setting will be valid.

Setting Digital Input Functions

A Positioning Unit supports one digital input. Use the following procedure to set functionality. To set the functionality of the digital input rising and falling edges, refer to the *General Tab Page* on page 259.

1,2,3... 1. Click the **IN** Tab in the Edit Unit Parameters Window to display the *IN* Tab Page shown below.

eneral	OUT IN Positio	ning		
	F Delay : 0			
	Power ON Delay Power Disable	C Enable		
No.	I/O Comment	Detection	Value	
00		Time	0	

2. Select the digital input (No. 00) and click the **Edit** Button. The Edit Terminal Dialog Box will be displayed.

• Terminal O Comment :	_	_			
Detection Mode	Time		0.0	ount	
Value	0 (0 - 429 0 - 429	349672 349672	95 Time: 95 Seco	s) nds)
	ОК		Cano	el	

3. Set the items in the dialog box as shown in the following table.

ltem	Description
I/O Comment	Enter a comment for the digital input.
Detection Mode	Specify whether to keep track of the total ON time (unit: s) or number of contact operations (unit: operations) for the mainte- nance counter of the digital input.
Value	Enter the set value for the detection mode.
	The value can be set to between 0 and 4,294,967,295 opera- tions for the number of contact operations and to between 0 and 4,294,967,295 seconds for the total ON time.

The above settings are stored in non-volatile memory. If the setting is changed, the Positioning Unit must be reset before the new setting will be valid.

Setting Positioning Functions

A Positioning Unit supports one counter input.

Click the **Positioning** Tab in the Edit Unit Parameters Window to display the *Positioning* Tab Page shown below.

🗌 🕅 Rangel 🔲 🗖 Rangel			
General Preset			
Parameter Name	1	Value	
0000 Configuration tag	1	0	
0001 Counter Input Mode	1	Phase differential x1	
0002 Action on Input Rising Edge	1	No Action	-
0003 Action on Input Falling Edge	1	No Action	
0004 A /: D E	10		-
Help Help String	1	Default : 0 Min : 0 Max : 255	
Default Setting			

The Positioning Tab Page contains up to four tab pages used to set various counter functionality. The Range 0 and Range 1 Tab Pages appear only when the *Range 0* and *Range 1* Check Boxes are selected.

HelpHelp is provided at the bottom of each tab page inside the Positioning TabPage, along with the default setting and setting limits.

General Tab Page The General Tab Page is used to set operating parameters, as described below.

These settings are stored in non-volatile memory. If a setting is changed, the Positioning Unit must be reset before the new setting will be valid.

■ Configuration Tag

The configuration tag indicates the version of all the present counter parameter settings. The configuration tag can be used to manage the parameter settings as a group.

The user can set the configuration tag to any value between 0 and 255. The configuration tag is downloaded with the rest of the parameter settings to the Counter Unit and uploaded with the rest of the parameter settings from the Counter Unit.

Counter Input Mode

Select one of the following counter input modes.

Counter input mode	Description
Phase differential ×1	Phase-shifted pulses are received on inputs A and B.
	• When the pulses on input A lead the pulses on input B, the counter value is incremented on the falling edge of input A.
	• When the pulses on input B lead the pulses on input A, the counter value is decremented on the rising edge of input A.
Phase differential ×2	Phase-shifted pulses are received on inputs A and B.
	• When the pulses on input A lead the pulses on input B, the counter value is incremented.
	• When the pulses on input B lead the pulses on input A, the counter value is decremented.
	• The counter value is changed on the rising and falling edges of input A.
Phase differential ×4	Phase-shifted pulses are received on inputs A and B.
	• When the pulses on input A lead the pulses on input B, the counter value is incremented.
	• When the pulses on input B lead the pulses on input A, the counter value is decremented.
	• The counter value is changed on the rising and falling edge of both input A and input B.
Pulse and direction	Input A pulses are counted and input B determines the direc- tion of counting.
	While input B is OFF, the counter value is incremented.
	While input B is ON, the counter value is decremented.
	• The counter value is changed on the falling edge of input A.
Up/down Counter	• The counter value is incremented when pulses are received on input A.
	• The counter value is decremented when pulses are received on input B.
	• The counter value is changed on the falling edge of input A or B.

Phase Differential Counting

The following figure illustrates the operation of phase differential counting.

Input A										<u>،</u>						
Input B					$\overline{\mathbf{v}}$		V									
×1	0	1		2		3				2			1			2
×2	0 1	2	3	4	5	6		5	4	3	2		1	2	3	4
×4	0 1	234	56	78	910	11 1 :	2 1	1109	87	65	43	2	1	234	156	78

Action	Description
No Action	No action is executed.
Capture	The Present Counter Value is stored in the Capture Value Register. The captured value can be retrieved at any time using the Counter Data Display Command Bit (bit 04 of word n+2).
Reset	The counter value is reset to 0.
Preset	The counter value is set to the preset value in the Preset Value Register.

Action upon Bus Error

Select the action to be executed when a bus error occurs.

Action	Description
Outputs are Cleared	The output status will be cleared until the bus error is removed, but the counter value will still be updated according to the encoder inputs.
	The output status will continue to be updated and the counter value will still be updated according to the encoder inputs.

■ Action upon Bus Idle

Select the action to be executed when the bus goes idle (i.e., when an error occurs in host communications, such as a DeviceNet or PROFIBUS error).

Action	Description
Outputs are Cleared	The output status will be cleared until the bus idle is removed, but the counter value will still be updated according to the encoder inputs.
Outputs keep functionality	The output status will continue to be updated and the counter value will still be updated according to the encoder inputs.

■ <u>Default Settings</u>

Press the **Default Setting** Button on the *General* Tab Page to set the following default values.

Setting	Default value		
Counter Input Mode	Phase differential ×1		
Action on Input Rising Edge	No Action		
Action on Input Falling Edge	No Action		
Action upon Bus Error	Outputs are cleared.		
Action upon Bus Idle	Outputs are cleared.		
Configuration tag	(Not affected.)		

Preset Tab Page

The Preset Tab Page is used to set the counter to a preset value. The counter can be set to the preset value using the *Action on Input Rising Edge* or *Action on Input Falling Edge* setting for the digital input or using the Preset Command Bit (bit 10 of word n+2).

Click the **Preset** Tab in the Edit Unit Parameters Window. The *Preset* Tab Page will be displayed.

dit Unit Parameters - #03 GRT1-CP1-L General OUT IN Positioning Function Choice Range0 Range1 General Preset	×
Parameter Name 0000 Preset value	Value
Help Help String	Default : 0 Min : -2147483648 Max : 2147483647
Default Setting	
	OK Cancel

Preset Value

Set the *Preset value* Field to the desired preset value. The set value will be stored in the Preset Value Register.

The following figure shows how the preset value works. In this example, a fixed frequency is input from the encoder to the counter and the preset value is set to 1000.

The preset value can be set to between -2,147,483,648 (8000 0000 hex) and 2,147,483,647 (7FFF FFFF hex).

This setting is stored in non-volatile memory. If the setting is changed, the new value is effective immediately.

Default Settings

Press the **Default Setting** Button on the *Preset* Tab Page to set the following default value.

Setting	Default value
Preset value	0

Range 0 and Range 1 TabA Positioning Unit supports two comparison ranges, one for each digital output. The tab page to set a comparison range is displayed only when the range is enabled. Click the Range 0 or Range 1 Button on the Positioning Tab Page to enable using the range and display the Range 0 or Range 1 Tab Page. The digital output will not be controlled by the comparison function unless the corresponding range is set.

The Range 0 Tab Page is used to describe the functionality in this manual, but the functionality is the same for range 1.

Note The digital output will be controlled by the corresponding range only when the Output 0 Control Bits (bits 12 and 13 of word n+2) or Output 1 Control Bits (bits 14 and 15 of word n+2) are OFF.

The Range 0 Tab Page is used to set a comparison range for the counter value. The range has a lower limit (LL0) and an upper limit (UL0). The digital output can be controlled according to the counter value in respect to this range. Range 0 controls the digital output 0 (OUT0).

Click the **Range 0** Tab in the Edit Unit Parameters Window. The *Range 0* Tab Page will be displayed.

eral DUT IN Positioning Inction Choice ▼ Range0	. L
General Preset Range0	Value
0000 Lower limit1 0001 Upper limit1	2147483647 -2147483648
Help Help String	Default : 2147483647 Min : -2147483648 Max : 2147483647
Default Setting	

Operation

The output will be controlled according to the relationship between the counter value and the range settings as follows:

- If UL0 > LL0, digital output 0 will be ON when LL0 ≤ Counter value ≤ UL0, and will be OFF otherwise.
- If UL0 < LL0, digital output 0 will be OFF when UL0 \leq Counter value \leq LL0, and will be ON otherwise.
- If UL0 = LL0, digital output 0 will be ON when LL0 = Counter value = UL0, and will be OFF otherwise.

The following figures illustrate the first two cases.

Case 1: UL0 > LL0

Setting a Comparison Range

Enter the desired values in the *Lower limit* and *Upper limit* Fields. The values can be between -2,147,483,648 (8000 0000 hex) and 2,147,483,647 (7FFF FFFF hex).

These settings are stored in non-volatile memory. If a setting is changed, the new value is effective immediately.

The range will be disabled if the range values are set to the minimum and maximum values.

Default Settings

Press the **Default Setting** Button on the *Range 0* or *Range 1* Tab Page to set the following default values.

Setting	Default value
Range 0	Disabled. (Option not selected.)
Range 1	Disabled. (Option not selected.)

SECTION 8 Other Units

This section provides the basic specifications and shows the components, wiring diagrams, and dimensions for the other Units used in Slice I/O Terminals.

8-1	GRT1-TBR Right Turnback Unit	268
8-2	GRT1-TBL Left Turnback Unit	268
8-3	GRT1-PD2 and GRT1-PD2G I/O Power Feed Units	269
8-4	GRT1-PD8(-1) I/O Power Feed Units and GRT1-PC8(-1) I/O Power Connection Units	271
8-5	GRT1-END End Unit	273
GRT1-TBR Right Turnback Unit

GRT1-TBR Right Turnback Unit 8-1

When a Slice I/O Terminal is divided into blocks to expand the system, mount a GRT1-TBR Right Turnback Unit to the right side of the first block, start a new block with a GRT1-TBL Left Turnback Unit, and connect the two Turnback Units with a GCN2-100 Turnback Cable.

Dimensions

GRT1-TBL Left Turnback Unit 8-2

When a Slice I/O Terminal is divided into blocks to expand the system, mount a GRT1-TBR Right Turnback Unit to the right side of the first block, start a new block with a GRT1-TBL Left Turnback Unit, and connect the two Turnback Units with a GCN2-100 Turnback Cable.

Note When dividing the power supply, always wire the power from the same power supply that supplies the Communications Unit.

Component Names and Functions

Dimensions

8-3 GRT1-PD2 and GRT1-PD2G I/O Power Feed Units

These Units are used to feed additional I/O power within the Slice I/O Terminal.

ltem	Specification				
Model	GRT1-PD2	GRT1-PD2G			
Power supply volt- age	20.4 to 26.4 V DC (24 V DC, -15 to +10%)				
Current capacity	4 A				
Overcurrent protec- tion		Yes			
Reverse-current pro- tection		Yes			
V terminals	2	2			
G terminals	2	2			

ltem	Specification		
Reset terminals		1	
Reset V (R) termi- nals		1	

There are three methods that can be used to reset the overcurrent status of GRT1-PD2G.

- Short the RESET terminal to the V (R) terminal. The overcurrent protection function will be automatically reset.
- Connect the RESET terminal to an output terminal of a Transistor Output Unit (e.g., the GRT1-OD4-1 (PNP)) and turn ON the output signal for at least 100 ms. If the Output Unit and I/O Power Feed Unit are connected to different I/O power sources, ground them to the same point.
- Cycle the power supply. The overcurrent protection function will be automatically reset.

LED Indicators

Component Names and Functions

I/O PWR Indicator

ERR Indicator

The I/O PWR indicator shows the status of the I/O power supply.

The ERR indicator shows the status of the overcurrent protection function.

Name	Color	Status	Meaning		
I/O PWR	Green	Lit	Normal status	I/O power is being supplied nor- mally.	
		Not lit	Error status or no power	I/O power is not being supplied or an overcurrent occurred.	
ERR	Red	Lit	Error status	An overcurrent occurred.	
		Not lit	Normal status or no power	I/O power is being supplied nor- mally or I/O power is not being supplied.	

Wiring

Note Connecting the RESET and V(R) terminals will continuously reset the overcurrent protection.

Dimensions

8-4 GRT1-PD8(-1) I/O Power Feed Units and GRT1-PC8(-1) I/O Power Connection Units

The GRT1-PD8 and GRT1-PD8-1 are used to provide additional I/O power within the Slice I/O Terminal. The GRT1-PD8, GRT1-PD8-1, GRT1-PC8 and GRT1-PC8-1 are used to provide extra voltage and ground terminals, i.e., for 8-point Input Units and 8-point Output Units.

Item	Specification		
Model	GRT1-PC8 and GRT1-PC8-1	GRT1-PD8 and GRT1-PD8-1	
I/O power feed voltage (from terminal connector)		20.4 to 26.4 V DC (24 V DC -15% to +10%)	
I/O power feed current (from terminal connector)		4 A max.	

ltem	Specification		
Number of voltage terminals	GRT1-PC8: Eight	GRT1-PD8: Eight	
	GRT1-PC8-1: Four	GRT1-PD8-1: Four	
Number of ground terminals	GRT1-PC8: Four	GRT1-PD8: Four	
	GRT1-PC8-1: Eight	GRT1-PD8-1: Eight	
I/O power voltage (to voltage terminal)	20.4 to 26.4 V DC (24 V DC -15% to +10%)		
I/O power current (to voltage	0.75 A max. per terminal		
terminal)	4 A max. per Unit		
Isolation between Unit power and I/O power	20 M Ω min. at 250 V DC		

Component Names and Functions (Same for GRT1-PD8, GRT1-PD8-1, GRT1-PC8 and GRT1-PC8-1)

Wiring

For examples of wiring in combination with the GRT1-ID8 or GRT1-ID8-1, refer to 4-6-3 *Eight-point DC Input Units: GRT1-ID8 (NPN) and GRT1-ID8-1 (PNP)*. For examples of wiring in combination with the GRT1-OD8, GRT1-OD8-1, or GRT1-OD8G-1 refer to 4-6-4 *Eight-point Transistor Output Units: GRT1-OD8 (NPN), GRT1-OD8-1 (PNP), and GRT1-OD8G-1 (PNP)*.

Dimensions (Same for GRT1-PD8, GRT1-PD8-1, GRT1-PC8 and GRT1-PC8-1)

8-5 GRT1-END End Unit

An End Unit must be mounted at the very end of the Slice I/O Terminal.

Dimensions

SECTION 9 Troubleshooting

This section describes error processing and troubleshooting procedures needed to keep the Slice I/O Units operating properly.

9-1	Trouble	shooting Overview	276
	9-1-1	Checking the Slice I/O Terminal's Status	276
	9-1-2	LED Indicators	276
9-2	LED In	dicators and Error Processing	277
9-3	Reading	g the Error History with a Programming Device	281
	9-3-1	Checking Maintenance Information	281
	9-3-2	Error History	284
9-4	Other E	Crrors	285
9-5	Trouble	shooting by Unit	286

9-1-1 Checking the Slice I/O Terminal's Status

The following two methods can be used to check for Slice I/O Terminal errors. Use the appropriate method for the conditions.

Method	Programming Device	Features
Using LED indicators	Not required.	The general error status can be determined without using the Programming Device.
Using Programming Device	Required.	The Programming Device can be used to find detailed information about the error from the error contents.

9-1-2 LED Indicators

The following LED indicators in the Slice I/O Terminal show the system status. The Slice I/O Terminal is operating normally when all of the LED indicators are lit green (including indicators on the Communications Unit, Slice I/O Units, Turnback Units, etc.).

Example: Slice I/O Terminal with a DeviceNet Communications Unit

- MS LED: Indicates the status of the DeviceNet Communications Unit.
- NS LED: Indicates the status of DeviceNet communications.
- TS LED: Indicates the status of the entire Slice I/O Terminal.
- UNIT PWR: Indicates the status of the Unit power supply.
- I/O PWR: Indicates the status of the I/O power supply.

9-2 LED Indicators and Error Processing

The following table shows the meaning of the LED indicators on each Unit used in a Slice I/O Terminal, as well as error processing required when an error is indicated.

Unit	LED name	Color	Status	Meaning	Likely cause of error	
Communica- tions Unit			>MS	Unit operating normally.		
(DeviceNet Communica-			MS	Power is not being supplied to the Unit.	Check whether power is being supplied by the Unit power supply.	
tions Unit indi- cators shown)		Red) MS	Unit hardware failure	Turn the power OFF and then ON again. Replace the Unit if the error recurs.	
		Red		Parameter data is invalid.	Use a Programming Device to write the cor- rect data again.	
			MS /	Backup data is invalid.	Backup the data again.	
				Registration table data is invalid.	Register the I/O configuration table again.	
	NS	Green	>NS	DeviceNet communications are normal.		
			NS	Waiting for completion of node address duplication check.	If the problem occurs only in a particular Unit, check the baud rate and restart the Unit.	
		Red		There is a node address duplication error at another Unit in the DeviceNet network.	Set the node addresses again to eliminate the duplication, and restart the Slice I/O Terminal.	
				DeviceNet communications stopped because of too many data errors.	Check the following items and restart the Slice I/O Terminal.	
					 Is the baud rate the same as the Master's? 	
			>NS _		 Are lengths of cables (trunk and branch lines) correct? 	
		Red			 Are cables short-circuited, broken, or loose? 	
					 Is terminating resistance connected to both ends of the trunk line only? 	
					Is noise interference excessive?	
			Red	DeviceNet communications	Check the following items.	
					timeout occurred.	 Is the baud rate the same as the Master's? Are lengths of cables (trunk and branch lines) correct?
			>NS		Are cables short-circuited, broken, or loose?	
		Green			 Is terminating resistance connected to both ends of the trunk line only? 	
					Is noise interference excessive?	
				Online with DeviceNet, but	Check whether the Master has started	
				NS (waiting for a connection with the Master.	properly. Check whether the Slice I/O Terminal is reg- istered in the Master's scan list.

Unit	LED name	Color	Status	Meaning	Likely cause of error
Communica- tions Unit, continued	TS	Green) TS (The Slice bus is operating normally.	
(DeviceNet			TS	Power is not being supplied to the Unit.	Check whether power is being supplied by the Unit power supply.
Communica- tions Unit indi- cators shown)		Red	TS (Slice I/O Unit configuration error occurred.	 Check the following items. Are more than 64 I/O Units connected? Are more than 128 bytes of I/O data being used? Has the I/O configuration changed since the I/O configuration table was registered?
		Red		Backup operation failed.	Backup the data again.
) (for 2 s)	Restore operation failed.	Reinstall the Unit in which the data was being restored and turn the power ON again.
		Red		Slice bus communications error occurred.	Check whether the Slice I/O Terminal's base block is connected properly.
			>NS	When the registration table function is enabled, the actual configuration does not match the registered configuration.	Correct the configuration and turn the power ON again.
		Green		The total number of I/O points in the Slice I/O Terminals exceeds the maximum.	Correct the Unit configuration and number of I/O points and turn the power ON again.
			NS /	Restore operation in progress	Wait until the restore operation is completed.
				Backup operation in progress	Wait until the backup operation is completed.
				Joining nodes to network	Wait until the nodes have been added to the network.
	UNIT PWR	Green		Unit power supply is providing power normally.	
				Unit power supply is not being supplied to the Unit.	Check whether power is being supplied by the Unit power supply.
	IO PWR	Green		I/O power supply is providing power normally.	
				I/O power supply is not being supplied to the Unit.	Check whether power is being supplied by the I/O power supply.

Unit	LED name	Color	Status	Meaning	Likely cause of error
Slice I/O Units	TS	Green	TS (Slice I/O Unit operating nor- mally.	
			TS	Unit power supply is not being supplied to the Unit.	Check whether power is being supplied by the Unit power supply.
		Red	TS	Unit hardware failure	Turn the power OFF and then ON again. Replace the Unit if the error recurs.
			TS	Communications error occurred.	 Check whether the connector on the Turnback Cable is inserted properly. Check the location of the Cable to see if the Turnback Cables and I/O lines are not wired too near the power lines.
			TS	Error in switch settings.	Check to be sure that the switch settings are not set to an invalid setting (GRT1-AD2, GRT1-DA2 \Box , GRT1-TS2P).
				Cold junction compensator error occurred.	Check the cold junction compensation (on the GRT1-TS2T only).
		Green	TS	Restore operation in progress	Wait until the restore operation is completed.
				Backup operation in progress	Wait until the backup operation is com- pleted.
Slice I/O Unit (GRT1-TS2⊟)	ERR0	Red	\	Input error occurred in input 0.	 Check the following items. Check if the sensor is disconnected, never was connected, short-circuited, or wired incorrectly. Check the terminal block to see if it is disconnected.
					 If using a 2-wire connection, check to be sure the SHT terminals are shorted. Check the sensor to see if it is of the cor- rect input type. Check to see if the temperature is outside the convertible temperature range.
				There is no input error for input 0.	
	ERR1	Red)(Input error occurred in input 1.	 Check the following items. Check if the sensor is disconnected, never was connected, short-circuited, or wired incorrectly. Check the terminal block to see if it is disconnected. If using a 2-wire connection, check to be
					 sure the SHT terminals are shorted. Check the sensor to see if it is of the correct input type. Check to see if the temperature is outside the convertible temperature range.
				There is no input error for input 1.	
GRT1-OD4G- 3	PWR	Green		Lit	I/O power and Unit power are being supplied.
				Not lit	I/O power or Unit power is not being supplied.

Unit	LED name	Color	Status	Meaning	Likely cause of error
GRT1-PD2, GRT1-PD8, and GRT1- PD8-1 I/O Power Feed Units	IO PWR	Green)(I/O power is being supplied normally.	
or GRT1-PC8, and GRT1- PC8-1 I/O Power Connection Units				I/O power is not being supplied to the Unit.	Check whether power is being supplied from the I/O power supply.
GRT1-PD2G	IO PWR	Green)□(I/O power is being supplied normally.	
				I/O power is not being sup- plied to the Unit or an overcur- rent occurred.	Check whether power is being supplied from the I/O power supply or check ERR indicator.
GRT1-TBL Left Turnback	UNIT PWR	Green		Unit power supply is providing power normally.	
Unit				Unit power supply is not being supplied to the Unit.	Check whether power is being supplied by the Unit power supply.
	IO PWR	Green		I/O power supply is providing power normally.	
				I/O power supply is not being supplied to the Unit.	Check whether power is being supplied by the I/O power supply.

Status	Likely cause and remedy
The Communications Unit's Unit Power LED is flashing.	The Unit power supply capacity is insufficient. Check the entire Slice I/O Terminal's power supply requirement and replace the power supply with one that has sufficient capacity.
The Communications Unit repeatedly checks LEDs. (A DeviceNet Communication Unit's MS/NS LED flash green and red).	The Unit power supply capacity is insufficient. Check the entire Slice I/O Terminal's power supply requirement and replace the power supply with one that has sufficient capacity.
The I/O Unit repeatedly checks LEDs (TS LED flash- ing green and red).	
The Communications Unit's TS indicator flashes green.	The slide connector on the left side of the affected Unit is not connected properly. Connect this slide connector properly and turn the power ON again.
The I/O Unit's indicator in front of the bad connection lights green and the indicator	Communications I/O Unit Indicator Unit Indicator
behind the bad connection goes OFF.	LED Indicator
	Bad connection
The Communications Unit's TS indicator flashes green and the I/O Unit's TS indicator lights green.	The End Unit is not connected properly. Connect the End Unit properly and turn the power ON again. Communications I/O Unit Indicator Unit Indicator LED Indicators End Unit Bad connection
The TS indicator is light green on all of the Slice I/O Termi- nals and the Communications Unit indicators do not indicate an error. The output indicators on the Digital Output Units are ON while the outputs are being sent from the Master Unit, but the outputs are actu- ally OFF.	The Slice I/O Unit is not properly connected to the base block (see below). The I/O power is cut off. Check the Slice I/O Units and make sure that each one is connected mated properly to the adjacent Units. (Refer to 3-1-2 Connecting Additional Slice I/O Units.)

9-5 Troubleshooting by Unit

Model	Details	Probable cause	Remedy
Temperature Input Unit (GRT1-TS2⊡)	Status does not turn ON even if the monitoring set value is exceeded.	 Relevant function is not enabled. Status turns OFF regardless of other conditions when mon- itoring set value is 0. Monitoring set value was set with an incorrect number of decimal places. 	 Enable the corresponding function. Set the monitoring set value to a value other than 0. Check the number of decimal places and reset the set value.
	 The expected temperature input value cannot be achieved even if the input type, display mode, and units are changed. Unit does not operate as expected even if the data allo- cated to the I/O, or the func- tion enable bit is changed. 	• The change will not be reflected unless the Unit's power supply is cycled or the Configurator is reset after the change.	Cycle the power supply or reset the Configurator.

Model	Details	Probable cause	Remedy
Temperature Input Unit (GRT1-TS2□), continued	• Temperature input data is not as expected, or the tempera- ture input data error is large.	Function allocation for the I/O data is incorrect.	• Check that the correct temper- ature input data has been allo- cated to the I/O data.
	• An Off-wire condition was detected even though there is no Off-wire condition.	 Scaling is being performed. 	 When performing scaling, check whether or not the scal- ing values are correct. If the scaling function is unin- tentionally turned ON, turn it OFF.
		• The sensor being connected and the Unit's input type are different.	Check the input type setting.
		• User adjustment error is large.	Check the user adjustment set- ting.
		• An error in the 1/100 and nor- mal Display Modes.	• The display value 100 times the input value in 1/100 Dis-
		An error reading the sensor's decimal point position.	play Mode regardless of the selected input type. Check that the correct display value is set in the Unit.
		The Slice I/O Terminal is not mounted in the standard orien- tation.	Check the mounting orientation.
	Cannot set the input type with the external switch.	• SW4 is turned OFF (default)	• Turn SW4 ON.
	User adjustment settings are not accepted.	• Adjustment was performed with an input that was outside of the acceptable setting range.	 Enter the correct input resistance and perform correction again. Check the adjustment system and correct if necessary.
	Off-wire display will not go out.	The sensor is disconnected.	• Fix the sensor disconnection.
		• The temperature is far outside of the sensor's measurement temperature range.	 Check the connected sensor, input type setting, and temper- ature range.
		• The input type is incorrect for the temperature being measured.	
	 Top/valley status will not turn ON. Top/valley occurrences are not being counted. 	• The hysteresis setting is too high for the amount of temper- ature change.	• Decrease the hysteresis to correspond with the amount of temperature change.
		• Hysteresis is set to 0.	 Set hysteresis to a value other than 0.
		 Top/valley function is not enabled. 	• Enable the top/valley function. (After enabling the function, it is necessary to reset the Con- figurator or cycle the power supply.)
	 Top/valley status turns ON frequently. Top/valley count is higher than expected. 	 Hysteresis is set too low for the amount of temperature change. 	• Increase the hysteresis to cor- respond with the amount of temperature change.

Model	Details	Probable cause	Remedy
Temperature Input Unit (GRT1-TS2□), continued	The scaling value overflows or underflows. (Temperature data at time of overflow: 7FFE hex, Temperature data at time of underflow: 8000 hex)	Offset set value is too large, so the scaled value has exceeded the display range.	Decrease the offset setting so that the scaled value does not exceed the scaling value dis- play range.
	Monitoring set value turns ON immediately.	Monitoring set value is not set appropriately.	Check the monitoring set value.
	Temperature values are not being counted even though they meet the count conditions of the zone counter.	Comparator function is not enabled.	• Enable the comparator. (After enabling, it is necessary to reset the Configurator or cycle the power supply.)
	Unit does not operate as expected even after the com- parator function and hysteresis have been set.	 The temperature display unit setting is not correct (°C or °F). The decimal point position was read incorrectly. 	Check the decimal point posi- tion and °C/ °F display for the input type and display mode. If these settings have been changed during operation, check the comparator and hys- teresis settings and correct if necessary.
	The temperature difference detected by the data compari- son between channels function is not operating properly.	• Data other than the tempera- ture value is allocated as the I/O data. (The 1/100 Display Mode must be used for the data comparison between channels function.)	 Assign the temperature value to the I/O data.
	The I/O comment or Unit com- ment cannot be set.	A comment longer than 32 characters is being set.	Set a comment of 32 characters maximum.
	 The Unit Maintenance Status Flag will not go ON. The Connected Device Main- tenance Status Flag will not go ON. 	The maintenance status func- tion is set to OFF if the monitor- ing set value is set to 0.	Set the monitoring set value to a non-zero value.

Appendix A Explicit Messages

DeviceNet explicit messages sent from the Master Unit to a GRT1-series DeviceNet Communications Unit can be used to read or write any parameter of a specified GRT1-series DeviceNet Communications Unit.

The DeviceNet Communications Units process the commands sent from the Master and then return responses.

Basic Format of Explicit Messages

The basic format of each command and response is shown below.

Command Block

Destination	Service	Class	Instance	Attribute	Data
node address	code	ID	ID	ID	

Destination Node Address

The node address of the Unit that is sending the explicit messages (commands) is specified as a single-byte hexadecimal.

Service Code, Class ID, Instance ID, Attribute ID

The parameters used for specifying the command, processing object, and processing content.

Note The number of bytes designated for Class ID, Instance ID, and Attribute ID depend on the Master Unit. When sent from an OMRON DeviceNet Master, the Class ID and Instance ID are 2 bytes (4 digits), and Attribute ID is 1 byte (2 digits).

Class ID

If the class ID is 0×80 to 0×90 , a message is being sent to a Slice I/O Unit via the Communications Unit.

Instance ID

This parameter gives the unit number of the Slice I/O Unit (1 to 63).

<u>Data</u>

Data is not required when the read command is used.

Response Block

Normal Response Block

Number of bytes	Source node	Service code	Data
received	address		

Error Response Block

Number of bytes received:	Source node address	Service code	Error code
0004 hex (fixed)			

Number of Bytes Received

The number of bytes received from the source node address is returned in hexadecimal. When an error response is returned for an explicit message, the number of bytes is always 0004 hex.

Source Node Address

The node address of the node from which the command was sent is returned in hexadecimal.

Service Code

For normal completion, the value when the leftmost bit of the service code specified in the command turns ON is stored as shown in the following table.

Function	Command service code	Response service code		
Write data	10 hex	90 hex		
Read data	0E hex	8E hex		
Reset	05 hex	85 hex		
Save	16 hex	96 hex		

When an error response is returned for an explicit message, the value is always 94 hex.

<u>Data</u>

Read data is included only when a read command is executed.

Error Codes

The explicit message error code. For details, refer to the list of error codes in the following table.

List of Error Codes

Response code	Error name	Cause
08FF	Service not supported	The Service code is incorrect.
09FF	Invalid Attribute value	The specified Attribute value is not supported.
		The data written was outside valid range.
16FF	Object does not exist	The specified Instance ID is not supported.
15FF	Too much data	The data is larger than the specified size.
13FF	Not enough data	The data is smaller than the specified size.
0CFF	Object state conflict	The specified command cannot be executed due to an internal error.
20FF	Invalid parameter	The specified operation command data is not supported.
0EFF	Attribute not settable	An Attribute ID supported only for reading has been executed for a write service code.
10FF	Device state conflict	The specified command cannot be executed due to an internal error.
14FF	Attribute not supported	The specified Attribute is not supported.
19FF	Store operation failure	The data cannot be stored in memory.
2AFF	Group 2 only server general failure	The specified command or Attribute is not supported or the Attribute was not set.

Explicit Messages Shared by All Slice I/O Units

Reading Status

Explicit	Read/write	Function			Command			Response
message			Service code	Class ID	Instance ID	Attribute ID	Data size	
Warning Information Read	Read	Reads the Slice I/O Unit's warn- ing status data.	0E hex	8D hex	01 to 40 hex (See note.)	72 hex		2 bytes
Alarm Infor- mation Read	Read	Reads the Slice I/O Unit's alarm status data.	0E hex	8D hex	01 to 40 hex (See note.)	73 hex		2 bytes

Note The Instance ID specifies the Slice I/O Unit's unit number (1 to 63 decimal).

Setting and Monitoring the Unit Conduction Time

Explicit	Read/	Function			Comma	and		Response
message	write		Service code	Class ID	Instance ID	Attribute ID	Data size	
Unit Main- tenance Set Value	Read	Reads the set value for the Slice I/O Unit's Unit Conduc- tion Time (Power ON time, unit: 0.1 hr)	0E hex	8D hex	01 to 40 hex (See note.)	70 hex		4 bytes 0000 0000 to FFFF FFFF hex (0 to 4,294,967,295 decimal)
	Write	Writes the set value for the Slice I/O Unit's Unit Conduc- tion Time (Power ON time, unit: 0.1 hr)	10 hex	8D hex	01 to 40 hex (See note.)	70 hex	4 bytes 0000 0000 to FFFF FFFF hex (0 to 4,294,967,29 5 decimal)	
Unit Main- tenance Present Value	Read	Reads the present value for the Slice I/O Unit's Unit Con- duction Time (Power ON time, unit: 0.1 hr)	0E hex	8D hex	01 to 40 hex (See note.)	6E hex		4 bytes 0000 0000 to FFFF FFFF hex (0 to 4,294,967,295 decimal)
Unit Main- tenance Flag	Read	Reads the monitor status of the Slice I/O Unit's Unit Con- duction Time (Power ON time)	0E hex	8D hex	01 to 40 hex (See note.)	6F hex		1 byte 00 hex: Within range 01 hex: Out of range (over the monitor value)

Note The Instance ID specifies the Slice I/O Unit's unit number (1 to 63 decimal).

Explicit Messages for Digital I/O Units

Setting and Monitoring Input Terminals

Explicit	Read/	Function			Comm	and		Response
message	write		Service code	Class ID	Instance ID	Attribute ID	Data size	
Terminal Mainte- nance Infor- mation Monitor Mode	Read	Reads the input's monitor mode for maintenance infor- mation.	0E hex	8E hex	01 to 40 hex ^{*1}	74 hex		4 bytes 0: Total ON time mode 1: Contact oper- ation counter mode The mode is read for inputs 0 to 32.*6
	Write	Writes the input's monitor mode for maintenance infor- mation.	10 hex	8E hex	01 to 40 hex ^{*1}	74 hex	4 bytes 0: Total ON time mode 1: Contact oper- ation counter mode The mode is set for inputs 0 to 32. ^{*6}	
Set Value of Input Main- tenance Counter	Read	Reads the set value for the total ON time (unit: s) or number of contact opera- tions (unit: opera- tions) the input (0 to 3, or 0 to 7 for an Eight-input Unit) specified by the Attribute ID.	0E hex	8E hex	01 to 40 hex ^{*1}	66 hex ^{*2} 69 hex ^{*3} 6C hex ^{*4} 6F hex ^{*5} 9C hex ^{*6} 9F hex ^{*7} A2 hex ^{*8} A5 hex ^{*9}		4 bytes 0000 0000 to FFFF FFFF hex (0 to 4,294,967,295 decimal)
	Write	Writes the set value for the total ON time (unit: s) or number of contact opera- tions (unit: opera- tions) for the input (0 to 3, or 0 to 7 for an Eight-input Unit) specified by the Attribute ID.	10 hex	8E hex	01 to 40 hex ^{*1}	66 hex ^{*2} 69 hex ^{*3} 6C hex ^{*4} 6F hex ^{*5} 9C hex ^{*6} 9F hex ^{*7} A2 hex ^{*8} A5 hex ^{*9}	4 bytes 0000 0000 to FFFF FFFF hex (0 to 4,294,967,295 decimal)	
Read Input Mainte- nance Counter	Read	Reads the total ON time (unit: s) or number of contact operations (unit: operations) for the input (0 to 3, or 0 to 7 for an Eight-input Unit) specified by the Attribute ID.	0E hex	8E hex	01 to 40 hex ^{*1}	65 hex ^{*2} 68 hex ^{*3} 6B hex ^{*4} 6E hex ^{*5} 9B hex ^{*6} 9E hex ^{*7} A1 hex ^{*8} A4 hex ^{*9}		4 bytes 0000 0000 to FFFF FFFF hex (0 to 4,294,967,295 decimal)

Explicit Messages

Explicit	Read/	Function			Comm	nand		Response
message	write		Service code	Class ID	Instance ID	Attribute ID	Data size	
Reset Input Mainte- nance Counter	Reset	Resets the total ON time (unit: s) or number of contact operations (unit: operations) for the input (0 to 3, or 0 to 7 for an Eight-input Unit) specified by the Attribute ID.	05 hex	8E hex	01 to 40 hex ^{*1}	65 hex ^{*2} 68 hex ^{*3} 6B hex ^{*4} 6E hex ^{*5} 9B hex ^{*6} 9E hex ^{*7} A1 hex ^{*8} A4 hex ^{*9}		
Read Moni- tor Status of Input Main- tenance Counter	Read	Reads the monitor status for total ON time or number of contact operations for the input.	0E hex	8E hex	01 to 40 hex ^{*1}	75 hex		4 bytes 0: In range 1: Out-of-range (over the moni- tor value) The status is read for inputs 0 to 32. ^{*6}

Note (1) The Instance ID specifies the Slice I/O Unit's unit number (1 to 64 decimal).

- (2) Specifies input 0.
- (3) Specifies input 1.
- (4) Specifies input 2.
- (5) Specifies input 3.
- (6) Specified input 4 (Eight-input Units only).
- (7) Specified input 5 (Eight-input Units only).
- (8) Specified input 6 (Eight-input Units only).
- (9) Specified input 7 (Eight-input Units only).

Setting and Monitoring Output Terminals

Explicit	Read/	Function			Comm	and		Response
message	write		Service code	Class ID	Instance ID	Attribute ID	Data size	
Terminal Mainte- nance Infor- mation Monitor Mode	Read	Reads the specified output's monitor mode for mainte- nance information.	0E hex	8E hex	01 to 40 hex ^{*1}	85 hex		4 bytes 0: Total ON time mode 1: Contact oper- ation counter mode The mode is read for out- puts 0 to 3. ^{*6}
	Write	Writes the specified output's monitor mode for mainte- nance information.	10 hex	8E hex	01 to 40 hex ^{*1}	85 hex	4 bytes 0: Total ON time mode 1: Contact oper- ation counter mode The mode is set for outputs 0 to 3. ^{*6} Set all other bits to 0.	·
Set Value of Output Mainte- nance Counter	Read	Reads the set value for the total ON time (unit: s) or number of contact opera- tions (unit: opera- tions) the output (0 to 3, or 0 to 7 for an Eight-output Unit) specified by the Attribute ID.	0E hex	8E hex	01 to 40 hex ^{*1}	78 hex ^{*2} 7B hex ^{*3} 7E hex ^{*4} 81 hex ^{*5} A8 hex ^{*6} AB hex ^{*7} AE hex ^{*8} B1 hex ^{*9}		4 bytes 0000 0000 to FFFF FFFF hex (0 to 4294967295 decimal)
	Write	Writes the set value for the total ON time (unit: s) or number of contact opera- tions (unit: opera- tions) for the output (0 to 3, or 0 to 7 for an Eight-output Unit) specified by the Attribute ID.	10 hex	8E hex	01 to 40 hex ^{*1}	78 hex ^{*2} 7B hex ^{*3} 7E hex ^{*4} 81 hex ^{*5} A8 hex ^{*6} AB hex ^{*7} AE hex ^{*8} B1 hex ^{*9}	4 bytes 0000 0000 to FFFF FFFF hex (0 to 4294967295 decimal)	
Read Out- put Mainte- nance Counter	Read	Reads the total ON time (unit: s) or number of contact operations (unit: operations) for the output (0 to 3, or 0 to 7 for an Eight-out- put Unit) specified by the Attribute ID.	0E hex	8E hex	01 to 40 hex ^{*1}	77 hex ^{*2} 7A hex ^{*3} 7D hex ^{*4} 80 hex ^{*5} A7 hex ^{*6} AA hex ^{*7} AD hex ^{*8} B0 hex ^{*9}		4 bytes 0000 0000 to FFFF FFFF hex (0 to 4294967295 decimal)

Explicit Messages

Explicit	Read/	Function			Comm	and		Response
message	write		Service code	Class ID	Instance ID	Attribute ID	Data size	
Reset Out- put Mainte- nance Counter	Reset	Resets the total ON time (unit: s) or number of contact operations (unit: operations) for the output (0 to 3, or 0 to 7 for an Eight-out- put Unit) specified by the Attribute ID.	05 hex	8E hex	01 to 40 hex ^{*1}	77 hex ^{*2} 7A hex ^{*3} 7D hex ^{*4} 80 hex ^{*5} A7 hex ^{*6} AA hex ^{*7} AD hex ^{*8} B0 hex ^{*9}		
Read Moni- tor Status of Output Mainte- nance Counter	Read	Reads the monitor status for total ON time or number of contact operations for the outputs.	0E hex	8E hex	01 to 40 hex ^{*1}	86 hex		4 bytes Read informa- tion for points 0 to 32. 0: In range 1: Out-of-range (over the moni- tor value) The status is read for out- puts 0 to 32. ^{*6}

Note (1) The Instance ID specifies the Slice I/O Unit's unit number (1 to 64 decimal).

- (2) Specifies output 0.
- (3) Specifies output 1.
- (4) Specifies output 2.
- (5) Specifies output 3.
- (6) Specified output 4 (Eight-output Units only).
- (7) Specified output 5 (Eight-output Units only).
- (8) Specified output 6 (Eight-output Units only).
- (9) Specified output 7 (Eight-output Units only).

Setting and Monitoring the Operation Time

Explicit	Read/	Function			Comm	and		Response
message	write		Service code	Class ID	Instance ID	Attribute ID	Data size	
Set Value for Opera- tion Time Monitor	Read	Reads the monitor set value for the operation time (unit: ms) specified by the Attribute ID.	0E hex	8E hex	01 to 40 hex ^{*1}	8B hex ^{*2} 93 hex ^{*3}		2 bytes 0000 to FFFF hex (0 to 65,535 decimal)
	Write	Writes the monitor set value for the operation time (unit: ms) specified by the Attribute ID.	10 hex	8E hex	01 to 40 hex ^{*1}	8B hex ^{*2} 93 hex ^{*3}	2 bytes 0000 to FFFF hex (0 to 65,535 decimal)	
Present Value for Operation Time Moni- tor	Read	Reads the present value for the opera- tion time (unit: ms) specified by the Attribute ID.	0E hex	8E hex	01 to 40 hex ^{*1}	8A hex ^{*2} 92 hex ^{*3}		2 bytes 0000 to FFFF hex (0 to 65,535 decimal)
Monitor Status for Operation Time Moni- tor	Read	Reads the monitor status for the opera- tion time (unit: ms) specified by the Attribute ID.	0E hex	8E hex	01 to 40 hex ^{*1}	87 hex ^{*4}		2 bytes 0000 to FFFF hex (0 to 65,535 decimal)
Operation Time Moni- tor Peak Value Read	Read	Reads the peak value for the opera- tion time (unit: ms) specified by the Attribute ID.	0E hex	8E hex	01 to 40 hex ^{*1}	8C hex ^{*2} 94 hex ^{*3}		2 bytes 0000 to FFFF hex (0 to 65,535 decimal)
Operation Time Moni- tor Peak Value Reset	Reset	Resets to the present value the peak value for the operation time (unit: ms) specified by the Attribute ID.	05 hex	8E hex	01 to 40 hex ^{*1}	8C hex ^{*2} 94 hex ^{*3}	2 bytes 0000 to FFFF hex (0 to 65,535 decimal)	
Operation Time Moni- tor History Read	Read	Reads the history of the monitor status for the operation time (unit: ms) spec- ified by the Attribute ID.	0E hex	8E hex	01 to 40 hex ^{*1}	8F hex ^{*2} 97 hex ^{*3}		1 byte 00 hex: Value not exceeded 01 hex: Value exceeded
Operation Time Moni- tor History Reset	Reset	Resets to 0 the his- tory of the monitor status for the opera- tion time (unit: ms) specified by the Attribute ID.	05 hex	8E hex	01 to 40 hex ^{*1}	8F hex ^{*2} 97 hex ^{*3}		

Note (1) The Instance ID specifies the Slice I/O Unit's unit number (1 to 63 decimal).

- (2) Specifies operation time 1.
- (3) Specifies operation time 2.
- (4) Reads data for both operation time 1 and operation time 2.

Setting Hold/Clear for Communications Errors (Output)

Explicit	Read/	Function			Comma	and		Response
message	write		Service code	Class ID	Instance ID	Attribute ID	Data size	
Setting for Output Sta- tus (Hold or Clear) after Communi- cations Error	Read	Reads whether each output's sta- tus will be cleared or held when there is a communications error.	0E hex	8E hex	01 to 40 hex ^{*1}	83 hex		4 bytes Status of bits 00 to 03 of 1st byte: 0: Clear 1: Hold The mode is read for outputs 0 to 3. ^{*3}
	Write	Sets whether each output's status will be cleared or held when there is a communications error.	10 hex	8E hex	01 to 40 hex ^{*1}	83 hex	4 bytes Status of bits 00 to 03 of 1st byte: 0: Clear 1: Hold The mode is set for out- puts 0 to 3.*3 Set all other bits to 0.	

Note (1) The default setting is for all outputs to be cleared (0).

Writing Maintenance Information

Explicit	Read/	Function			Comma	and		Response
message write		Service code	Class ID	Instance ID	Attribute ID	Data size		
Mainte- nance Counter Save	Save	Records the mainte- nance counter in the Slice I/O Unit's memory.	16 hex	8D hex	01 to 40 hex ^{*1}	71 hex		

Explicit Messages for Analog Slaves

Setting and Reading for Analog Input Units

Explicit	Read				Comn	nand		Response
message	/write		Service code	Class ID	Instance ID	Attribute ID	Data	
Analog Data 1 Value	Read	Reads the value for Analog Data 1.	0E hex	8F hex	01 to 40 hex ^{*1}	65 hex ^{*2} 8D hex ^{*3}		2 byte
Analog Data 2 Value	Read	Reads the value for Analog Data 2.	0E hex	8F hex	01 to 40 hex ^{*1}	68 hex ^{*2} 90 hex ^{*3}		2 bytes
Number of AD Conver- sion Points Setting	Write/ Read	Sets the number of AD conversion points.	Write: 10 hex Read: 0E hex	8F hex	01 to 40 hex ^{*1}	64 hex	2 bytes	1 byte

Explicit Messages

Appendix A

Explicit	Read	Function			Comn	nand		Response
message	/write		Service code	Class ID	Instance ID	Attribute ID	Data	
Input Range Set- ting	Write/ Read	Sets the input range. -10 to 10 V: 0 0 to 5 V: 1 0 to 10 V: 2 4 to 20 mA: 3 1 to 5 V: 7 0 to 20 mA: 8	Write: 10 hex Read: 0E hex	8F hex	01 to 04 hex ^{*1}	66 hex ^{*2} 8E hex ^{*3}	1 byte	1 byte
Analog Sta- tus Flag Read	Read	Reads the status of the Analog Status Flags. LL = 0; L = 1; Pass signal = 2; H = 3; HH = 4; Valley shot = 5; Top shot = 6; Off-wire detection = 7	0E hex	8F hex	01 to 40 hex ^{*1}	69 hex ^{*2} 91 hex ^{*3}		1 byte
Analog Data 1 Allo- cation Selection	Write/ Read	Selects the data allo- cated to Analog Data 1. Analog input value: 0; Peak value: 1; Bottom value: 2; Top value: 3; Valley value: 4; Rate of change value: 5	Write: 10 hex Read: 0E hex	8F hex	01 to 40 hex ^{*1}	6B hex ^{*2} 93 hex ^{*3}	1 byte	1 byte
Analog Data 2 Allo- cation Selection	Write/ Read	Selects the data allo- cated to Analog Data 2. Analog input value: 0; Peak value: 1; Bottom value: 2; Top value: 3; Valley value: 4; Rate of change value: 5	Write: 10 hex Read: 0E hex	8F hex	01 to 40 hex ^{*1}	6C hex ^{*2} 94 hex ^{*3}	1 byte	1 byte
Function Setting	Write/ Read	Sets each function. Bit status: ON: Enabled, OFF: Disabled Moving average: 0; Scaling: 1; Peak/bottom hold: 2; Top/valley hold: 3; Comparator: 4; Cumulative counter: 5; Rate of change: 6	Write: 10 hex Read: 0E hex	8F hex	01 to 40 hex ^{*1}	6D hex ^{*2} 95 hex	1 byte	1 byte
Scaling Type Set- ting	Write/ Read	Default scaling: 0: User scaling: 1	Write: 10 hex Read: 0E hex	8F hex	01 to 40 hex ^{*1}	6E hex ^{*2} 96 hex	1 byte	1 byte
Scaling Point 1 Set- ting	Write/ Read	Sets an analog value as the 0% value for user scaling.	Write: 10 hex Read: 0E hex	8F hex	01 to 40 hex ^{*1}	6F hex ^{*2} 97 hex ^{*3}	2 bytes (–28000 to 28000)	2 bytes (–28000 to 28000)
Scaling Point 2 Set- ting	Write/ Read	Sets an analog value as the 100% value for user scaling.	Write: 10 hex Read: 0E hex	8F hex	01 to 40 hex ^{*1}	70 hex ^{*2} 98 hex ^{*3}	2 bytes (–28000 to 28000)	2 bytes (–28000 to 28000)
Offset Compensa- tion after Scaling	Write/ Read	Compensates for scal- ing errors after scaling with an offset value.	Write: 10 hex Read: 0E hex	8F hex	01 to 40 hex ^{*1}	71 hex ^{*2} 99 hex ^{*3}	2 bytes (–28000 to 28000)	2 bytes (–28000 to 28000)

Explicit Messages

Appendix A

Explicit	Read	Function			Comn	nand		Response
message	/write		Service code	Class ID	Instance ID	Attribute ID	Data	
Maximum Value Read	Read/ Reset		Read: 0E hex Reset: 35 hex	8F hex	01 to 40 hex ^{*1}	72 hex ^{*2} 9A hex ^{*3}		2 bytes
Minimum Value Read	Read/ Reset		Read: 0E hex Reset: 35 hex	8F hex	01 to 40 hex ^{*1}	73 hex ^{*2} 9B hex ^{*3}		2 bytes

Bottom Value Read	Read	The bottom value is held and read.	0E hex	8F hex	01 to 40 hex ^{*1}	75 hex ^{*2} 9D hex ^{*3}		2 bytes
Top Value Read	Read	The top value is held and read.	0E hex	8F hex	01 to 40 hex ^{*1}	76 hex ^{*2} 9E hex ^{*3}		2 bytes
Top Detec- tion Timing Flag Read	Read	Reads the timing for detecting top values.	0E hex	8F hex	01 to 40 hex ^{*1}	77 hex ^{*2} 9F hex ^{*3}		1 byte
Valley Value Read	Read	The valley value is held and read.	0E hex	8F hex	01 to 40 hex ^{*1}	78 hex ^{*2} A0 hex ^{*3}		2 bytes
Valley Detection Timing Flag Read	Read	Reads the timing for detecting valley values.	0E hex	8F hex	01 to 40 hex ^{*1}	79 hex ^{*2} A1 hex ^{*3}		1 byte
HH Value Setting	Write/ Read	Sets the HH value.	Write: 10 hex Read: 0E hex	8F hex	01 to 40 hex ^{*1}	7C hex ^{*2} A4 hex ^{*3}	2 bytes (-32768 to 32767)	2 bytes (-32768 to 32767)
LL Value Setting	Write/ Read	Sets the LL value.	Write: 10 hex Read: 0E hex	8F hex	01 to 40 hex ^{*1}	7D hex ^{*2} A5 hex ^{*3}	2 bytes (-32768 to 32767)	2 bytes (–32768 to 32767)
H Value Setting	Write/ Read	Sets the H value.	Write: 10 hex Read: 0E hex	8F hex	01 to 40 hex ^{*1}	7E hex ^{*2} A6 hex ^{*3}	2 bytes (-32768 to 32767)	2 bytes (–32768 to 32767)
L Value Setting	Write/ Read	Sets the L value.	Write: 10 hex Read: 0E hex	8F hex	01 to 40 hex ^{*1}	7F hex ^{*2} A7 hex ^{*3}	2 bytes (-32768 to 32767)	2 bytes (–32768 to 32767)
Scaled Analog Input Value Read	Read	Reads analog input val- ues for which have only been scaled.	0E hex	8F hex	01 to 40 hex ^{*1}	84 hex ^{*2} AC hex ^{*3}		2 bytes
Rate of Change Value Read	Read	Reads the rate of change for each sam- pling cycle.	0E hex	8F hex	01 to 40 hex ^{*1}	85 hex ^{*2} AD hex ^{*3}		2 bytes
Sampling Cycle Set- ting	Write/ Read	Sets the sampling cycle for obtaining the rate of change based on the previous value.	Write: 10 hex Read: 0E hex	8F hex	01 to 40 hex ^{*1}	86 hex ^{*2} AE hex ^{*3}	GRT1-AD2: 2 bytes (10 to 65535)	GRT1-AD2: 2 bytes (10 to 65535)

Explicit	Read	Function			Response			
message	/write		Service code	Class ID	Instance ID	Attribute ID	Data	
Cumulated Value Read	Read/ Reset		Read: 0E hex Reset: 35 hex	8F hex	01 to 40 hex ^{*1}	87 hex ^{*2} AF hex ^{*3}		4 bytes (-214748364.8 to 214748364.7)
Cumulative Counter Flag Read	Read	Reads the cumulative count status in the Cumulative Counter Flag in the area for Generic Status Flags. 0: Counter overflow 1: Counter underflow 7: Set value overflow	Read: 0E hex	8F hex	01 to 40 hex ^{*1}	88 hex ^{*2} B0 hex ^{*3}		1 byte
Cumulative Counter Monitor Value Set- ting	Write/ Read	Writes/reads the set monitor value for the cumulative counter.	Write: 10 hex Read: 0E hex	8F hex	01 to 40 hex ^{*1}	89 hex ^{*2} B1 hex ^{*3}	4 bytes	4 bytes
Cumulative Counter Unit Setting	Write/ Read	Sets the unit for the cumulative counter. 0: Hour (count hours); 1: Minute (count minutes)	Write: 10 hex Read: 0E hex	8F hex	01 to 40 hex ^{*1}	8A hex ^{*2} B2 hex ^{*3}	1 byte	1 byte

Note (1) The Instance ID specifies the Slice I/O Unit's unit number (1 to 64).

- (2) Specifies input 0.
- (3) Specifies input 1.

Setting and Reading for Analog Output Units

Explicit	Read	Function			Comn	nand		Response
message	/write		Service code	Class ID	Instance ID	Attribute ID	Data Size	
Setting the Number of DA Conver- sion Points	Write/ Read	Sets the number of DA conversion points.	Write: 10 hex Read: 0E hex	90 hex	01 to 40 hex ^{*1}	64 hex	2 bytes	1 byte
Analog Out- put Value Read	Read	Reads analog output values.	0E hex	90 hex	01 to 40 hex ^{*1}	67 hex ^{*2} 7D hex ^{*3}		2 bytes
Output Range Set- ting	Write/ Read	Sets the output range. 4 to 20 mA: 0; 0 to 10 V: 1; 0 to 20 mA: 2; -10 to 10 V: 3; 0 to 5 V: 4; 1 to 5 V: 6	0E hex	90 hex	01 to 40 hex ^{*1}	68 hex ^{*2} 7E hex ^{*3}		1 byte
Slice Bus Error Out- put Setting	Write/ Read	Sets the Slice Bus error output value for each output. 0: Hold last state 1: Low limit 2: High limit 3: Zero count Operation example: Turnback Cable discon- nect.	Write: 10 hex Read: 0E hex	90 hex	01 to 40 hex ^{*1}	6C hex ^{*2} 82 hex ^{*3}	1 byte	1 byte

Explicit Messages

Appendix A

Explicit	Read	Function		Response				
message	/write		Service code	Class ID	Instance ID	Attribute ID	Data Size	
Communi- cations Error Out- put Setting	Write/ Read	Sets the communica- tions error output value for each output. 0: Hold last state 1: Low limit 2: High limit 3: Zero count	Write: 10 hex Read: 0E hex	90 hex	01 to 40 hex ^{*1}	6D hex ^{*2} 83 hex ^{*3}	1 byte	1 byte
		Operation example: communications error in Communications Unit.						
Function Setting	Write/ Read	Sets the function. Scaling: 0; Cumulative counter: 1	Write: 10 hex Read: 0E hex	90 hex	01 to 40 hex ^{*1}	6F hex ^{*2} 85 hex ^{*3}	1 byte	1 byte
Scaling Type Set- ting	Write/ Read	Default scaling: 0: User scaling: 1	Write: 10 hex Read: 0E hex	90 hex	01 to 40 hex ^{*1}	70 hex ^{*2} 86 hex ^{*3}	1 byte	
Scaling Point 1 Set- ting	Write/ Read	Sets a conversion value as the 0% value for user scaling.	Write: 10 hex Read: 0E hex	90 hex	01 to 40 hex ^{*1}	71 hex ^{*2} 87 hex ^{*3}	2 bytes (–28000 to 28000)	2 bytes (-28000 to 28000)
Scaling Point 2 Set- ting	Write/ Read	Sets a conversion value as the 100% value for user scaling.	Write: 10 hex Read: 0E hex	90 hex	01 to 40 hex ^{*1}	72 hex ^{*2} 88 hex ^{*3}	2 bytes (–28000 to 28000)	2 bytes (-28000 to 28000)
Offset Compensa- tion after Scaling	Write/ Read	Sets an offset to com- pensate for scaling error.	Write: 10 hex Read: 0E hex	90 hex	01 to 40 hex ^{*1}	73 hex ^{*2} 89 hex ^{*3}	2 bytes (–28000 to 28000)	2 bytes (-28000 to 28000)
Cumulated Value Read	Read/ Reset	Reads the cumulated analog output value.	Read: 0E hex Reset: 35 hex	90 hex	01 to 40 hex ^{*1}	77 hex ^{*2} 8D hex ^{*3}		4 bytes (-214748364.8 to 214748364.8)
Cumulative Counter Flag Read	Read	Reads the cumulative count status in the Cumulative Counter Flag in the area for Generic Status Flags. 0: Counter overflow 1: Counter underflow 7: Set value overflow	Read: 0E hex	90 hex	01 to 40 hex ^{*1}	78 hex ^{*2} 8E hex ^{*3}		1 byte
Cumulative Counter Monitor Value Set- ting	Write/ Read	Writes/reads the set monitor value for the cumulative counter.	Write: 10 hex Read: 0E hex	90 hex	01 to 40 hex ^{*1}	79 hex ^{*2} 8F ^{*3}	4 bytes	4 bytes
Cumulative Counter Unit Setting	Write/ Read	Sets the unit for the cumulative counter. 0: Hour (count hours); 1: Minute (count min- utes)	Write: 10 hex Read: 0E hex	90 hex	01 to 40 hex ^{*1}	7A hex ^{*2} 90 hex ^{*3}	1 byte	

Note (1) The Instance ID specifies the Slice I/O Unit's unit number (1 to 64).

(2) Specifies output 0.

(3) Specifies output 1.

Explicit Messages for Temperature Input Units

Explicit	Read	Function			Comn	nand		Response	
message	/write		Service code	Class ID	Instance ID	Attribute ID	Data		
Display For- mat Read (Normal or 1/100)	Read	Reads the display for- mat. Normal display: 0 1/100 display: 1	0E hex	8F hex	01 to 40 hex ^{*1}	65 hex		1 byte	
Tempera- ture Data Value Read for Normal Display	Read	Reads the value of tem- perature data.	0E hex	8F hex ^{*2} 90 hex ^{*3}	01 to 40 hex ^{*1}	9A hex		2 bytes	
Tempera- ture Data Value Read for 1/100 Display	Read	Reads the value of tem- perature data.	0E hex	8F hex ^{*2} 90 hex ^{*3}	01 to 40 hex ^{*1}	6B hex		4 bytes	
Input Type Set	Write/ Read	Sets the input type. GRT1-TS2P: PT100 (-200 to 850° C) = F hex PT100 (-200 to 200° C) = 11 hex GRT1-TS2PK: PT1000 (-200 to 850° C) =13 hex PT1000 (-200 to 200° C) =14 hex GRT1-TS2T: R = 00 hex, S = 01 hex, K1 = 02 hex, K2 = 03 hex, J1 = 04 hex, J2 = 05 hex, T = 06 hex, E = 07 hex, L1 = 08 hex, L2 = 09 hex, U = 0A hex, N = 0B hex, W = 0C hex, B = 0D hex, PL2 = 0E hex	Write: 10 hex Read: 0E hex	8F hex ^{*2} 90 hex ^{*3}	01 to 40 hex ^{*1}	97 hex	1 byte	1 byte	
User Adjustment Check	Read	Checks to see if user adjustment has been performed for the tem- perature conversion constant. User adjustment: 1 Default setting: 0	0E hex	8F hex ^{*2} 90 hex ^{*3}	01 to 40 hex ^{*1}	89 hex		1 byte	
Display Unit Read	Read	Reads the display unit. °C: 1200, °F: 1201	0E hex	8F hex ^{*2} 90 hex ^{*3}	01 to 40 hex ^{*1}	69 hex		2 bytes	
Tempera- ture Status Flag Read	Read	Reads the status of the Temperature Status Flags. LL = 0; L = 1; Pass signal = 2; H = 3; HH = 4; Valley shot = 5; Top shot = 6; Off-wire detection = 7	0E hex	8F hex ^{*2} 90 hex ^{*3}	01 to 40 hex ^{*1}	73 hex		1 byte	

Explicit Messages

Appendix A

Explicit	Read	Function			Response			
message	/write		Service code	Class ID	Instance ID	Attribute ID	Data	
Tempera- ture Data Allocation Selection	Write/ Read	Selects the data allo- cated to Temperature Data 1. Temperature input value: 0; Peak value: 1; Bottom value: 2; Top value: 3; Valley value: 4; Rate of change value: 5	Write: 10 hex Read: 0E hex	8F hex ^{*2} 90 hex ^{*3}	01 to 40 hex ^{*1}	75 hex	1 byte	1 byte
Function Setting	Write/ Read	Sets each function. Bit status: ON: Enabled, OFF: Disabled Moving average: 0; Scaling: 1; Peak/bottom hold: 2; Top/valley hold: 3; Comparator: 4; Cumulative counter: 5; Rate of change: 6 Input error detection dis- abled: 7	Write: 10 hex Read: 0E hex	8F hex ^{*2} 90 hex ^{*3}	01 to 40 hex ^{*1}	77 hex	2 bytes	2 bytes
Scaling Point 1 Set- ting	Write/ Read	Sets an temperature value as the 0% value for user scaling.	Write: 10 hex Read: 0E hex	8F hex ^{*2} 90 hex ^{*3}	01 to 40 hex ^{*1}	79 hex	2 bytes	2 bytes
Scaling Point 2 Set- ting	Write/ Read	Sets an temperature value as the 100% value for user scaling.	Write: 10 hex Read: 0E hex	8F hex ^{*2} 90 hex ^{*3}	01 to 40 hex ^{*1}	7A hex	2 bytes	2 bytes
Offset Compensa- tion after Scaling	Write/ Read	Sets an offset to com- pensate for scaling errors.	Write: 10 hex Read: 0E hex	8F hex ^{*2} 90 hex ^{*3}	01 to 40 hex ^{*1}	7B hex	2 bytes	2 bytes
Maximum Value Read	Read/ Reset	Reads the maximum value after power is turned ON.	Read: 0E hex Reset: 35 hex	8F hex ^{*2} 90 hex ^{*3}	01 to 40 hex ^{*1}	7C hex		4 bytes
Minimum Value Read	Read/ Reset		Read: 0E hex Reset: 35 hex	8F hex ^{*2} 90 hex ^{*3}	01 to 40 hex ^{*1}	7D hex		4 bytes
Peak Value Read	Read	The peak value while the hold function is operating is held and the peak value is read.	0E hex	8F hex ^{*2} 90 hex ^{*3}	01 to 40 hex ^{*1}	7E hex		4 bytes
Bottom Value Read	Read	The bottom value while the hold function is operating is held and the bottom value is read.	0E hex	8F hex ^{*2} 90 hex ^{*3}	01 to 40 hex ^{*1}	7F hex		4 bytes

Scaled Tempera- ture Input Value Read	Read	Reads temperature input values for which have only been scaled.	0E hex	8F hex ^{*2} 90 hex ^{*3}	01 to 40 hex ^{*1}	8B hex		4 bytes (-415000 to 415000)
Rate of Change Value Read	Read	Reads the rate of change for each sam- pling cycle.	0E hex	8F hex ^{*2} 90 hex ^{*3}	01 to 40 hex ^{*1}	8C hex		4 bytes (-415000 to 415000)
Sampling Cycle Set- ting	Write/ Read	Sets the sampling cycle for obtaining the rate of change based on the previous value. Set in multiples of 250 ms. (Default: 250 ms)	Write: 10 hex Read: 0E hex	8F hex ^{*2} 90 hex ^{*3}	01 to 40 hex ^{*1}	8D hex	2 bytes (250 to 65550)	2 bytes (250 to 65550)

Explicit	Read	Function			Comn	nand		Response
message	/write		Service code	Class ID	Instance ID	Attribute ID	Data	
Cumulated Value Read	Read/ Reset	Reads the cumulated temperature input value.	Read: 0E hex Reset: 35 hex	8F hex ^{*2} 90 hex ^{*3}	01 to 40 hex ^{*1}	8E hex		4 bytes (-214748364.8 to 214748364.7)
Cumulative Counter Flag Read	Read	Reads the cumulative count status in the Cumulative Counter Flag. 0: Counter overflow 1: Counter underflow 7: Set value overflow	0E hex	8F hex ^{*2} 90 hex ^{*3}	01 to 40 hex ^{*1}	8F hex		1 byte
Cumulative Counter Monitor Value Set- ting	Write/ Read	Writes/reads the set monitor value for the cumulative counter.	Write: 10 hex Read: 0E hex	8F hex ^{*2} 90 hex ^{*3}	01 to 40 hex ^{*1}	90 hex	4 bytes	4 bytes
Cumulative Counter Unit Setting	Write/ Read	Sets the unit for the cumulative counter. 0: Hour (count × hours); 1: Minute (count × minutes)	Write: 10 hex Read: 0E hex	8F hex ^{*2} 90 hex ^{*3}	01 to 40 hex ^{*1}	91 hex	1 byte	1 byte
Decimal Position Read	Read	Reads the position of the decimal point. 0000 = 0 0000.0 = 1 0000.00 = 2	0E hex	8F hex ^{*2} 90 hex ^{*3}	01 to 40 hex ^{*1}	98 hex		1 byte
Top/Valley Count Read	Read/ Reset	Reads the number of tops or valleys that have been counted.	Read: 0E hex Reset: 35 hex	8F hex ^{*2} 90 hex ^{*3}	01 to 40 hex ^{*1}	9E hex		4 bytes
Top/Valley Count Threshold Status Read	Read	Reads whether the top/valley count has exceeded the threshold value. 0: Counter overflow 1: Counter underflow 7: Set value overflow	0E hex	8F hex ^{*2} 90 hex ^{*3}	01 to 40 hex ^{*1}	9F hex		1 byte
Top/Valley Counting Selection	Write/ Read	Selects counting either tops or valleys. Count tops = 0 Count valleys = 1	Write: 10 hex Read: 0E hex	8F hex ^{*2} 90 hex ^{*3}	01 to 40 hex ^{*1}	A0 hex	1 byte	1 byte
Top/Valley Count Threshold Set	Write/ Read	Sets the threshold value to compare with the top/valley count.	Write: 10 hex Read: 0E hex	8F hex ^{*2} 90 hex ^{*3}	01 to 40 hex ^{*1}	A1 hex	4 bytes	4 bytes
Tempera- ture Range Total Time Read	Read/ Reset	Reads (in seconds) the time the system has been in a user-set tem- perature range.	Read: 0E hex Reset: 35 hex	8F hex ^{*2} 90 hex ^{*3}	01 to 40 hex ^{*1}	A2 hex	4 bytes	4 bytes

Explicit	Read	Function			Comn	nand		Response
message	/write		Service code	Class ID	Instance ID	Attribute ID	Data	_
Threshold Status for Tempera- ture Range Total Time Read	Read	Compares the time the system has been in a user-set temperature range with a threshold value. 0: Counter overflow 1: Counter underflow 7: Set value overflow	0E hex	8F hex ^{*2} 90 hex ^{*3}	01 to 40 hex ^{*1}	A3 hex		1 byte
Range for Tempera- ture Range Total Time Set	Write/ Read	Sets the range for timing the time in the set tem- perature range. Above HH = 0, Between HH and H = 1, Pass = 2, Between L and LL = 3, Below LL = 4	Write: 10 hex Read: 0E hex	8F hex ^{*2} 90 hex ^{*3}	01 to 40 hex ^{*1}	A4 hex	1 byte	1 byte
Threshold for Compar- ison with Tempera- ture Range Total Time Set/Read	Write/ Read	Sets (in seconds) the threshold value that is compared to the time in the user-set tempera- ture range.	Write: 10 hex Read: 0E hex	8F hex ^{*2} 90 hex ^{*3}	01 to 40 hex ^{*1}	A5 hex	4 bytes	4 bytes
Data Com- parison between Channels Read	Read	Reads the result of data comparison between channels.	0E hex	8F hex ^{*2} 90 hex ^{*3}	01 to 40 hex ^{*1}	AB hex		4 bytes
Data Com- parison between Channels Threshold Compare	Read	Compares the result of data comparison between channels with a threshold value and outputs the result. 0: Counter overflow 1: Counter underflow 6: Invalid data 7: Set value overflow	0E hex	8F hex ^{*2} 90 hex ^{*3}	01 to 40 hex ^{*1}	AC hex		1 byte
Data Com- parison between Channels Threshold Set	Write/ Read	Sets the threshold for comparison with the result of data compari- son between channels.	Write: 10 hex Read: 0E hex	8F hex ^{*2} 90 hex ^{*3}	01 to 40 hex ^{*1}	AD hex	4 bytes	4 bytes
Extension Status Flag Read	Read	Reads the Status Flags below. 1 to 7 OR = 0 1: Over range 2: Under range 3: Scaling overflow 4: Scaling underflow 5: Rate of change over- flow 6: Rate of change underflow 7: Sensor off-wire condi- tion	0E hex	8F hex ^{*2} 90 hex ^{*3}	01 to 40 hex ^{*1}	74 hex		1 byte

Note (1) The instance ID specifies the Slice I/O Unit's unit number (1 to 64).

(2) Specifies input 0.

- (3) Specifies input 1.
- (4) Parameter related to the data comparison between input 0 and input 1.
- (5) Parameter related to the data comparison between input 1 and input 0.

Explicit Messages for Counter Units and Positioning Units

Explicit	Read/	Function			Com	mand		Response
message	write		Service code	Class ID	Instance ID	Attribute ID	Data size	
Digital Input Monitor	Read	Reads the current status of the digi- tal input.	0E hex	8E hex	01 to 40 hex ^{*1}	64 hex		1 byte 00 hex: OFF 01 hex: ON
Digital Input Name	Read	Reads the com- ment set for the digital input.	0E hex	8E hex	01 to 40 hex ^{*1}	65 hex		1 to 32 bytes Contains the stored comment in ASCII.
	Write	Writes the com- ment for the digi- tal input.	10 hex	8E hex	01 to 40 hex ^{*1}	65 hex	1 to 32 bytes The comment to set in ASCII.	
Digital Input Mainte- nance Counter	Read	Reads the total ON time (unit: s) or number of con- tact operations (unit: operations) of the digital input.	0E hex	8E hex	01 to 40 hex ^{*1}	66 hex		4 bytes 0000 0000 to FFFF FFFF hex (0 to 4,294,967,295 decimal)
	Write	Writes the total ON time (unit: s) or number of con- tact operations (unit: operations) for the digital input.	10 hex	8E hex	01 to 40 hex ^{*1}	66 hex	4 bytes 0000 0000 to FFFF FFFF hex (0 to 4,294,967,295 decimal)	
	Reset	Resets the total ON time (unit: s) or number of con- tact operations (unit: operations) of the digital input.	05 hex	8E hex	01 to 40 hex ^{*1}	66 hex		
Digital Input Mainte- nance Counter Set Value	Read	Reads the set value for the total ON time (unit: s) or number of con- tact operations (unit: operations) of the digital input.	0E hex	8E hex	01 to 40 hex ^{*1}	67 hex		4 bytes 0000 0000 to FFFF FFFF hex (0 to 4,294,967,295 decimal)
	Write	Writes the set value for the total ON time (unit: s) or number of con- tact operations (unit: operations) for the digital input.	10 hex	8E hex	01 to 40 hex ^{*1}	67 hex	4 bytes 0000 0000 to FFFF FFFF hex (0 to 4,294,967,295 decimal)	

Explicit	Read/	Function			Com	mand		Response
message	write		Service code	Class ID	Instance ID	Attribute ID	Data size	
Input Power Supply Monitor	Read	Reads the status of the input power supply. If there is more than one input power supply, an AND of the sta- tus of all the input power supplies is returned.	0E hex	8E hex	01 to 40 hex ^{*1}	70 hex		1 byte 00 hex: ON 01 hex: OFF
Terminal Mainte- nance Infor- mation Mode Moni- tor of Digital Input	Read	Reads the moni- tor mode for maintenance information on the digital input.	0E hex	8E hex	01 to 40 hex ^{*1}	71 hex		4 bytes Status of bit 00 of 1st byte: 0: Total ON time mode 1: Contact opera- tion counter mode All other bits will be 0.
	Write	Writes the moni- tor mode for maintenance information for the digital input.	10 hex	8E hex	01 to 40 hex ^{*1}	71 hex	4 bytes Status of bit 00 of 1st byte: 0: Total ON time mode 1: Contact opera- tion counter mode Set all other bits to 0.	
Monitor Sta- tus of Digital Input Main- tenance Counter	Read	Reads the moni- tor status for the total ON time or number of contact operations for the digital input.	0E hex	8E hex	01 to 40 hex ^{*1}	72 hex		4 bytes Status of bit 00 of 1st byte: 0: In range 1: Out-of-range (over the monitor value)
Monitor Dig- ital Output Status	Read	Reads the current status of digital outputs. ^{*2}	0E hex	8E hex	01 to 40 hex ^{*1}	OUT0: 76 hex		1 byte 00 hex: OFF 01 hex: ON
Digital Out- put Names	Read	Reads the com- ments set for digi- tal outputs. ^{*2}	0E hex	8E hex	01 to 40 hex ^{*1}	OUT0: 77 hex		1 to 32 bytes Contains stored comment in ASCII.
	Write	Writes the com- ments for digital outputs. ^{*2}	10 hex	8E hex	01 to 40 hex ^{*1}	OUT0: 77 hex	1 to 32 bytes The comment to set in ASCII.	

Explicit	Read/	Function			Com	mand		Response
message	write		Service code	Class ID	Instance ID	Attribute ID	Data size	
Digital Out- put Mainte- nance Counter	Read	Reads the total ON time (unit: s) or number of con- tact operations (unit: operations) for digital out- puts. ^{*2}	0E hex	8E hex	01 to 40 hex ^{*1}	OUT0: 78 hex OUT1: 7C hex		4 bytes 0000 0000 to FFFF FFFF hex (0 to 4,294,967,295 decimal)
	Write	Writes the total ON time (unit: s) or number of con- tact operations (unit: operations) for digital out- puts. ^{*2}	0 hex	8E hex	01 to 40 hex ^{*1}	OUT0: 78 hex OUT1: 7C hex	4 bytes 0000 0000 to FFFF FFFF hex (0 to 4,294,967,295 decimal)	
	Reset	Resets the total ON time (unit: s) or number of con- tact operations (unit: operations) for digital out- puts. ^{*2}	05 hex	8E hex	01 to 40 hex ^{*1}	OUT0: 78 hex OUT1: 7C hex		
Digital Out- put Mainte- nance Counter Set Values	Read	Reads the set values for the total ON time (unit: s) or number of con- tact operations (unit: operations) for digital out- puts. ^{*2}	0E hex	8E hex	01 to 40 hex ^{*1}	OUT0: 79 hex OUT1: 7D hex		4 bytes 0000 0000 to FFFF FFFF hex (0 to 4,294,967,295 decimal)
	Write	Writes the set values for the total ON time (unit: s) or number of con- tact operations (unit: operations) for digital out- puts. ^{*2}	10 hex	8E hex	01 to 40 hex ^{*1}	OUT0: 79 hex OUT1: 7D hex	4 bytes 0000 0000 to FFFF FFFF hex (0 to 4,294,967,295 decimal)	
Output Power Sup- ply Monitor	Read	Reads the status of the input power supply. If there is more than one output power supply, an AND of the sta- tus of all the out- put power supplies is returned.	0E hex	8E hex	01 to 40 hex ^{*1}	82 hex		1 byte 00 hex: OFF 01 hex: ON

Lower Limit of Range 1	Read	Reads the present lower limit of range 1. ^{*3}	0E hex	8E hex	01 to 40 hex ^{*1}	8D hex		4 bytes Range of values: -2,147,483,648 to 2,147,483,647
Upper Limit of Range 1	Read	Reads the present upper limit of range 1. ^{*3}	0E hex	8E hex	01 to 40 hex ^{*1}	8E hex		4 bytes Range of values: -2,147,483,648 to 2,147,483,647

Explicit	Read/	Function			Com	mand		Response
message	write		Service code	Class ID	Instance ID	Attribute ID	Data size	
Preset Value	Read	Reads the present preset value.	0E hex	8E hex	01 to 40 hex ^{*1}	8F hex		4 bytes Range of values: -2,147,483,648 to 2,147,483,647
	Write	Writes the preset value.	10 hex	8E hex	01 to 40 hex ^{*1}	8F hex	4 bytes Range of values: -2,147,483,648 to 2,147,483,647	
Counter Input Mode	Read	Reads the present counter input mode.	0E hex	8E hex	01 to 40 hex ^{*1}	90 hex		1 byte 00 hex: Phase dif- ferential ×1 01 hex: Phase dif- ferential ×2 02 hex: Phase dif- ferential ×4 03 hex: Pulse/direction 04 hex: Up/down
	Write	Writes the counter input mode.	10 hex	8E hex	01 to 40 hex ^{*1}	90 hex	1 byte 00 hex: Phase dif- ferential ×1 01 hex: Phase dif- ferential ×2 02 hex: Phase dif- ferential ×4 03 hex: Pulse /direction 04 hex: Up/down	
Action on Rising Edge of Digital Input	Read	Reads the action performed on the rising edge of the digital input.	0E hex	8E hex	01 to 40 hex ^{*1}	91 hex		1 byte 00 hex: No action 01 hex: Capture 02 hex: Reset 03 hex: Preset
	Write	Writes the action performed on the rising edge of the digital input.	10 hex	8E hex	01 to 40 hex ^{*1}	91 hex	1 byte 00 hex: No action 01 hex: Capture 02 hex: Reset 03 hex: Preset	
Action on Falling Edge of Digital Input	Read	Reads the action performed on the falling edge of the digital input.	0E hex	8E hex	hex ^{*1}	92 hex		1 byte 00 hex: No action 01 hex: Capture 02 hex: Reset 03 hex: Preset
	Write	Writes the action performed on the falling edge of the digital input.	10 hex	8E hex	01 to 40 hex ^{*1}	92 hex	1 byte 00 hex: No action 01 hex: Capture 02 hex: Reset 03 hex: Preset	

Appendix A

Explicit	Read/	Function			Com	mand		Response
message	write		Service code	Class ID	Instance ID	Attribute ID	Data size	
Action on Bus Error	Read	Reads the action performed when a bus error occurs. The same setting applies to all out- puts.	0E hex	8E hex	01 to 40 hex ^{*1}	93 hex		1 byte 00 hex: Outputs are cleared on bus error. 01 hex: Output functionality is maintained on bus error.
	Write	Writes the action performed when a bus error occurs. The same setting applies to all out- puts.	10 hex	8E hex	01 to 40 hex ^{*1}	93 hex	1 byte 00 hex: Outputs are cleared on bus error. 01 hex: Output functionality is maintained on bus error.	
Configura- tion Tag	Read	Reads the present value of the configuration tag.	0E hex	8E hex	01 to 40 hex ^{*1}	94 hex		1 byte Range of values: 00 to FF hex (0 to 255 decimal)
	Write	Writes the value of the configura- tion tag.	10 hex	8E hex	01 to 40 hex ^{*1}	94 hex	1 byte Range of values: 00 to FF hex (0 to 255 decimal)	
Range 0	Write	Writes the upper and lower limits of range 0. ^{*3}	33 hex	8E hex	01 to 40 hex ^{*1}	95 hex	2×4 bytes Range of values: 8000 0000 to 7FFF FFFF hex (-2,147,483,648 to 2,147,483,647 decimal) ^{*4}	
Save Ranges and Preset Val- ues	Write	Writes the range settings and pre- set value to non- volatile memory.	10 hex	8E hex	01 to 40 hex ^{*1}	97 hex	1 byte Value: 00 hex	
Action on Bus Idle	Write	Writes the action performed when the bus enters idle state.	0E hex	8E hex	01 to 40 hex ^{*1}	98 hex	1 byte 00 hex: Outputs are cleared on bus idle. 01 hex: Output functionality is maintained on bus idle.	
	Read	Reads the action performed when the bus enters idle state.	0E hex	8E hex	01 to 40 hex ^{*1}	98 hex		1 byte 00 hex: Outputs are cleared on bus idle. 01 hex: Output functionality is maintained on bus idle.

Note (1) The Instance ID specifies the Slice I/O Unit's unit number (1 to 63 decimal).

(2) The data structure is as follows:

If you want to write "LL = 7FFF FFFF, UL = 8000 0000" use the following: FFFF FF7F 0000 0080.

Using Explicit Messages

The following example shows how to use explicit messages with a DeviceNet Communications Unit connected to a CS1W-DRM21 DeviceNet Unit.

Example: Sending a "Operation Time Monitor Peak Value Read" Command

Example: DeviceNet Unit's node address: 05

Unit number: 0

Unit address: FE hex (or 10 hex)

DeviceNet Communication Unit's node address: 11

Operation

Reads the measured operation time (time required for input 2 to go ON after input 0 goes ON) of the Slice I/O Unit with unit number 1.

The data is read using the EXPLICIT MESSAGE SEND command (2801).

The command data is written in words starting from D01000 in the PLC and the response data is stored in words starting from D02000.

If the command does not end normally, the end code is stored in D00006 and the send command is re-executed.

Command Details

• [CMND S D C] S: D01000 D (first response word): D02000 C: D00000

Contents of S

Address	Contents (hex)	Meaning
D01000	28 01	Command code
D01001	0B 0E	DeviceNet Communications Unit's node address: 11

D01002	00 8E	Class ID: 008E hex
D01003	00 01	Instance ID: 0001 hex
D01004	8C **	Attribute ID: 8C ** hex (Set any value for the blank digits.)

Contents of C

Address	Contents (hex)	Meaning
D00000	00 09	Number of bytes of command data
D00001	00 0C	Number of bytes of response data
D00002	00 00	Destination DeviceNet Unit's network address: 0
D00003	05 FE	Destination DeviceNet Unit's node address: 5
		Destination DeviceNet Unit's unit address: FE hex (or 10 hex)
D00004	00 00	Response required
		Communications port number: 0
		Number of retries: 0
D00005	00 3C	Response monitoring time: 6 s

Response

Contents of D

Address	Contents (hex)	Meaning
D02000	28 01	
D02001	00 00	
D02002	00 02	
D02003	0B 8E	Response source node address: 11 (0B hex)
		Normal completion: 8E hex
D02004 to D02005	00 00	Operation time monitor peak value

Appendix B Standard Models

Slice I/O Units

Model	Specifications	
GRT1-ID4	Four-point DC Input Unit (NPN)	
GRT1-ID4-1	Four-point DC Input Unit (PNP)	
GRT1-OD4	Four-point Transistor Output Unit (NPN)	
GRT1-OD4-1	Four-point Transistor Output Unit (PNP)	
GRT1-OD4G-1	Four-point Transistor Output Unit (PNP) with overcurrent and short-circuit protection	
GRT1-OD4G-3	Four-point 2-A Transistor Output Unit (PNP) with overcurrent and short-circuit protection	
GRT1-ID8	Eight-point DC Input Unit (NPN)	
GRT1-ID8-1	Eight-point DC Input Unit (PNP)	
GRT1-OD8	Eight-point Transistor Output Unit (NPN)	
GRT1-OD8-1	Eight-point Transistor Output Unit (PNP)	
GRT1-OD8G-1	Eight-point Transistor Output Unit (PNP) with overcurrent and short-circuit protection	
GRT1-IA4-1	Four-point AC Input Unit (Input voltage: 100 to 120 V AC 50/60 Hz)	
GRT1-IA4-2	Four-point AC Input Unit (Input voltage: 200 to 240 V AC 50/60 Hz)	
GRT1-ROS2	Two-point Relay Output Unit	
GRT1-AD2	Two-point Analog Output Unit	
GRT1-DA2V	Two-point Analog Voltage Output Unit	
GRT1-DA2C	Two-point Analog Current Output Unit	
GRT1-TS2P	Two-point Temperature Input Unit	
	Resistance thermometer input, Input type: PT100 (-200 to 850°C) or PT100 (-200 to 200°C)	
GRT1-TS2PK	Two-point Temperature Input Unit	
	Resistance thermometer input, Input type: PT1000 (-200 to 850°C) or PT1000 (-200 to 200°C)	
GRT1-TS2T	Two-point Temperature Input Unit	
	Thermocouple input, Input type: R, S, K J, T, E, B, N, L, U, W, or PL2	
GRT1-END	End Unit	
GRT1-PD2	I/O Power Feed Unit	
GRT1-PD2G	I/O Power Feed Unit with overcurrent protection	
GRT1-PD8	I/O Power Feed Unit with 8 voltage and 4 ground terminals	
GRT1-PD8-1	I/O Power Feed Unit with 4 voltage and 8 ground terminals	
GRT1-PC8	I/O Power Connection Unit with 8 voltage and 4 ground terminals	
GRT1-PC8-1	I/O Power Connection Unit with 4 voltage and 8 ground terminals	
GRT1-TBR	Right Turnback Unit (Mounts to the right side of Slice I/O Terminal.)	
GRT1-TBL	Left Turnback Unit (Mounts to the left side of Slice I/O Terminal. Can supply power to I/O Units.)	
GRT1-CT1	Counter Unit with one counter (with encoder A and B inputs), 1 input settable to an encoder Z input or a digital input, and 1 digital output (NPN)	
GRT1-CT1-1	Counter Unit with one counter (with encoder A and B inputs), 1 input settable to an encoder Z input or a digital input, and 1 digital output (PNP)	
GRT1-CP1-L	Positioning Unit with one counter (with encoder A, B, and Z inputs), 1 digital input, and 2 digital outputs (PNP)	

Communications Units

Model	Specifications	
GRT1-DRT	DeviceNet Communications Unit for Slice I/O Terminals	
	Up to 64 Slice I/O Units can be connected to one DeviceNet Communications Unit.	
GRT1-PRT	PROFIBUS Communications Unit for Slice I/O Terminals.	
	Up to 64 Slice I/O Units can be connected to one PROFIBUS Communications Unit.	

Connecting Cable for Slice I/O Terminal Turnback Units

Model	Specifications	
GCN2-100	Turnback Cable (1 m)	
	Up to two cables (two blocks) can be connected to one DeviceNet Communications Unit.	

Applicable Pin Terminals

Manufacturer	Model	
PHOENIX CONTACT	AI-0.5-10	0.5 mm ² (AWG 20)
	AI-0.75-10	0.75 mm ² (AWG 18)

Appendix E Precautions When Connecting Two-wire DC Sensors

When using a two-wire Sensor with a Communications Unit using DC inputs, check that the following conditions have been met. Failure to meet these conditions may result in operating errors.

Relationship between a DC Input-type Communications Unit's ON Voltage and a Sensor's Residual Voltage

 $V_{ON} \leq V_{CC} - V_R$

- V_{CC}: I/O power supply voltage (The allowable power supply voltage range is 20.4 to 26.4 V, so 20.4 V will be used here to allow for the worst possible conditions.)
- V_{ON}: ON voltage for a Communications Unit with DC Inputs
- V_R: Sensor's output residual voltage

It is sometimes possible to satisfy the above equation by adjusting the I/O power supply voltage (V_{CC}) to 26.4 V.

Relationship between a DC Input-type Communications Unit's ON Current and a Sensor's Control Output (Load Current)

 I_{OUT} (min) $\leq I_{ON} \leq I_{OUT}$ (max.)

I_{OUT}: Sensor control output (load current)

I_{ON}: Communications Unit ON current

 $I_{ON} = (V_{CC} - V_R - V_F)/R_{IN}$

- V_F: Internal residual voltage of a Communications Unit with DC Inputs
- R_{IN}: Input impedance of a Communications Unit with DC Inputs

When I_{ON} is smaller than I_{OUT} (min), connect a bleeder resistor R.

The bleeder resistor constant can be calculated using the following equation.

 $R \leq (V_{CC} - V_R) / (I_{OUT} \text{ (min.)} - I_{ON})$

Power W \ge (V_{CC} - V_R)²/R \times 4 [allowable margin]

Relationship between a DC Input-type Communications Unit's OFF Current and a Sensor's Leakage Current

 $I_{OFF} \geq I_{leak}$

I_{OUT}: OFF current of a Communications Unit with DC Inputs

Ileak: Sensor's leakage current

Connect a bleeder resistor if Ileak is greater than IOFF.

The bleeder resistor constant can be calculated using the following equation.

 $\mathsf{R} \leq (\mathsf{I}_{\mathsf{OFF}} \times \mathsf{R}_{\mathsf{IN}} + \mathsf{V}_{\mathsf{F}}) / (\mathsf{I}_{\mathsf{leak}} - \mathsf{V}_{\mathsf{OFF}})$

Power $W \ge (V_{CC} - V_R)^2/R \times 4$ [allowable margin]

S

scan lists precautions, xix screwless clamping terminal block wiring, 45 Slice I/O Terminals, 2 Slice I/O Units, 315 connecting additional Units, 31 specifications all Units, 12 general, 12 Slice I/O Units, 12 switches rotary switches precautions, xviii System Units, 8

Т

Temperature Input Units, 7 1/100 Display Mode, 174 Alarm Status Area, 159 comparator, 5, 155, 193 comparison with earlier models, 152 convertible temperature ranges, 169 cumulated count, 155 cumulative counter, 5 data comparison between channels, 6, 155, 198 data processing functions, 155 display modes, 173 Hold Flags, 158 hysteresis, 188, 194 I/O data, 157 input error detection disabling, 5 input type, 166 input type range, 168 last maintenance date, 155, 201 Maintenance Information Window, 160 moving average, 5, 155 Normal Display Mode, 173 offset compensation, 182 off-wire detection, 5, 155, 201 one-shot time, 189 operation results, 155 overview, 152 peak/bottom hold, 5, 155, 184 rate of change, 5, 155 rate of change calculation, 191 scaling, 5, 155, 181 six-dial resistance box, 213 temperature cumulative counter, 202 temperature data, 156 temperature data 1/100 display mode, 177 Temperature Data Normal Mode + Top/Valley Detection Timing Flags, 179 temperature input value, 155 Temperature Status Flags, 158, 178 temperature zone counter, 6 top or valley count, 5 top/valley count, 155

top/valley counter, 189 Top/Valley Detection Timing Flags, 157, 177 top/valley hold, 5, 155, 186 user adjustment, 5, 155, 205 Warning Status Area, 158 terminal blocks, 2 transferring I/O memory, xvii transferring I/O memory data, xvii TS indicator, 13 Turnback Units connecting, 40

U

unit comments, 3, 22 unit conduction time monitoring, 20 unit conduction time (power ON time) monitoring, 3 unit numbers automatic allocation, 3

W

wire recommended, 39 strip length, 39 wiring clamping terminal block, 45 precautions, xix screwless clamping terminal block, 45

Revision History

A manual revision code appears as a suffix to the catalog number on the front cover of the manual.

The following table outlines the changes made to the manual during each revision. Page numbers refer to the previous version.

Revision code	Date	Revised content
01	November 2005	Original production
02	March 2006	Revised to include Analog I/O Units.
03	July 2006	Revised to include Counter Units and Positioning Units.
04	March 2007	Revised to include the following Units: GRT1-OD4G-1, GRT1-ID8, GRT1-ID8-1, GRT1-OD8, GRT1-OD8-1, GRT1-OD8G-1, GRT1-PD8(-1), and GRT1-PC8(-1).
05	July 2007	Revised to include the Temperature Input Units.
06	NTLP	NTLP
07	October 2007	Revised to include the following Units: GRT1-IA4-1, GRT1-IA4-2, GRT1-TS2PK, GRT1-TS2T, GRT1-PD2G, and GRT1-OD4G-3.
